We trust that we have said enough to draw the attention of members of the Royal Institute and of builders and contractors to the importance of considering a revision of the strike clauses in building contracts, and if attention be once directed to the matter possibly combined consultation may produce a really satisfactory clause. We may, however, perhaps venture to suggest that what it is desirable to provide against in such clauses nowadays is not the existence of a trade dispute in any particular trade, but for exemption from liability in case of unavoidable delay occasioned by any trade dispute whatever; in other words, the test should be the inevitable delay occasioned by that new form of *force majeure*, the trade dispute. The architect under Art. 25, or the arbitrator under Art. 32, would have no more difficulty in determining the question of fact whether the works had or had not been delayed by the direct consequences of a strike outside the trade than is experienced at present in deciding whether a strike inside the trade was the cause of the delay.

In view of the magnitude and frequent occurrence of trade disputes, a question may also be raised whether in building contracts an absolute clause against liability from delay through trade disputes should not be introduced apart from the clause permitting an extension of time to be allowed by the architect. Upon this point we offer no opinion, but it must be remembered that under Art. 9 of the Institute's Form of Contract in these days of trade unionism the contractor may have a dispute forced upon him by the action of the architect. If the architect quite reasonably, under Art. 9, requires the dismissal of a person employed by the contractor, and that person happens to be a trade unionist, a general strike may at any moment be the result. A strike on a railway was recently occasioned by the removal of a signalman from one end of a station to the other.

The legislature has licensed strikes on a larger scale than heretofore, but in protecting trade unions has omitted to protect the trader. In the absence of statutory protection it therefore behoves those in trade carefully to provide for the new conditions of the labour market and to protect themselves as far as they are able in their contracts from a liability which may otherwise be forced upon them from causes wholly outside their control.

THE TRADE UNION BILL.

IT seems almost incredible that after the experiences of the past twelve months the Government should have reintroduced their Trade Union Bill, which first made its appearance last year, and which is designed to overrule the Osborne decision and to enable the trade unions to become militant political organisations.

With the political aspect of this question we are in no way concerned; but, as we pointed out last year in articles on June 2 and 30, there are grave objections to this Bill on other than strictly political grounds. It strengthens the hands of those societies which we should have thought had been demonstrated by the recent railway and coal strikes to be already too powerful, and it prejudices the position of non-union and independent men, rendering them liable not only to severe duress at the hands of trade societies, but complicating their position by importing political considerations into the relationship between workmen and workmen and employers and workmen. The trade unions already have power to prevent any man who is not willing to join them as trade societies from obtaining work or plying his avocation, but if this Bill becomes law a man willing to embrace trade union principles so far as trade relations are concerned may yet find himself ostracised by reason of his political convictions, and thus political pressure under the Bill will arise not only in connexion with Parliamentary elections, but also in respect to County Council elections, District Council elections, Parish Council elections, and even to elections to Boards of Guardians. The Bill is the same as that introduced last year, the only alteration being that it no longer provides that trade union funds may be expended on the maintenance of Members of Parliament, because this has since been made a charge upon the taxpayers; but with this exception in all the above elections the unions can expend money in connexion with the candidature and maintenance of persons seeking or obtaining office, and upon the holding of meetings and the distribution of literature, and thus these societies which have already been granted powers and immunities possessed by no other organisations in the country are encouraged to expand into political organisations, and trade unionism can hold up trade while it creates a political pandemonium at the election of even a parish councillor or member of a Board of Guardians. It is in this connexion that the most important point arises. Will sect. 4 of the Trade Disputes Act apply to acts done by trade unions in furtherance of the enlarged number of objects permitted by this Bill? It will be remembered that subsect. (1) of this section provides that "an action against a trade union, whether of workmen or masters, or against any members or officials thereof, on behalf of themselves and all other members of the trade union in respect of any tortious act alleged to have been committed by or on behalf of the trade union, shall not be entertained by any Court." In this subsection no mention is made of the acts thus privileged being limited to acts done "in contemplation or furtherance" of a trade dispute, and as we showed in our recent note to Vacher & Sons *v.* London Society of Compositors, April 12 last, it has not yet been judicially decided whether this subsection applies generally or with that limitation. There is even some doubt whether a trade union cannot publish a libel unconnected with a trade dispute and yet claim immunity from action under the above subsection. This point at least should be made clear, and the unions be made amenable to the law in respect of acts done under this Bill before the enlarged powers proposed are conferred upon them.

A second point is one raised last year by the Employers' Parliamentary Council. The Bill purports to secure the rights of those members of the unions who do not desire to contribute to political objects, and it provides in Clause 3 (*c*) that a member who claims exemption shall not be excluded from the benefits of the union or be placed under any disability. The Employers' Parliamentary Council asked how is a member who claims

exemption to obtain any redress if he is deprived of benefits, seeing that under sect. 4 of the Trade Union Act the Courts cannot enforce agreements as to benefit? Since this question was asked the House of Lords in Russell *v.* Amalgamated Society of Carpenters (the *Builder*, April 5 last) have affirmed the decisions that the Courts cannot interfere to enforce agreements as to benefit. It is, therefore, clear that if this Bill is to become law some provision must be inserted granting access to the Courts to a member of a trade union who has been deprived of benefits from the union in defiance of the provisions of the Bill simply because he objects to contribute to the political funds of the union.

Lastly, by Clause 3 (*a*) a majority "of the members voting" can determine whether the funds of the unions are or are not to be applied to political purposes. For a resolution of this character surely the unions should be compelled to obtain a majority of their members.

There are other grave objections to the Bill (for instance, should the unions who are to be entrusted with administrative powers under the Insurance Act be political societies?), but we have confined our observations to those of paramount importance.

LABOUR IN THE BUILDING TRADE.

At a Conference between the Edinburgh Master Builders' Association and operative joiners, the request of the joiners for an increase of pay and other alterations on working rules was discussed. The joiners asked for an increase of 1d. per hour, from 9d. to 10d. The master builders expressed the desire to see their employees as well off as possible, and would gladly have agreed to the increase asked had the state of the property market justified such an advance. In the circumstances they felt they would not be justified in agreeing to more than ½d. advance. A request to stop work at 12 noon on Saturdays was also preferred by the operatives. Several of the employers present expressed themselves strongly in favour of this, but it was felt that sufficient unanimity among the trades did not exist to enable this alteration to work smoothly this year, and the joiners, being usually responsible for seeing premises under construction or repair safely locked up, were strongly pressed to leave this over till next year, when, if the co-operation of the other trades were secured, it was thought this might be agreed to on behalf of the whole building trades. The joiners ultimately agreed to these suggestions. Several other points were discussed, and alterations in existing rules agreed to, which it was hoped would, by making these points more clear, result in their more strict observance. The new regulations come into force on June 1 next, and hold good for one year.

GOVERNMENT CONTRACTS.

The following tenders have been accepted during the past month by the Government Departments named:—*Admiralty, Works Department:* Works service: additional coast-guard houses at Kildonan—Messrs. R. Aitken-head & Son, 37, Trafalgar-street, Greenock. *War Office:* Works services: alterations to married quarters, etc., Fulwood Barracks, Preston—Messrs. R. Thompson & Morris, 13, Dalton-square, Lancaster; conversion of cottages, Warley—Mr. S. Cronin, Queen-street, Warley; erection of army ordnance depôt buildings, Tidworth—Messrs. Wort & Way, Castle street, Salisbury; erection of barrack block, cook house, latrines, etc., Army Service Corps Barracks, Bordon—Executors of Mr. J. B. Seward, Crown Works, Wokingham: erection of forges and shoeing, Longmore Camp—Messrs. Wigginton & Sons, St. Thomas-street, Portsmouth; erection of new sergeants' mess, Lydd—Mr. T. T. Denne, Walmer, Kent; installation of electric light and power, military hospital, York—Messrs. G. E. Taylor & Co., 3, Bush-lane, E.C.; periodical works services at Bulford Camp—Mr. D. E. Hutton, Briggate, Shipley, Yorks; repairs and maintenance of war department buildings at Bordon—Messrs. Martin, Wells, & Co., Aldershot; Colchester—Mr. F. R. Hipperson, Northumberland-street, Norwich; Warley—Mr. S Cronin, Queen-street, Warley; Woking—Mr E. C. Hughes, Albion Works, Wokingham. *Crown Agents for the Colonies:* Steel bridge-work and steel-framed building—Horseley Company, Ltd., Tipton, Staffs; cement—Associated Portland Cement Manufacturers, Ltd., 8, Lloyd's-avenue, E.C.; Messrs. Martin, Earle, & Co., Ltd., 139, Queen Victoria-street, E.C.; Messrs. Wouldham Cement Company, Ltd., 35, Great St. Helens, E.C.; stoneware pipes—Albion Clay Company, Ltd., 38, Victoria-street, S.W.; carriage washing sheds—Messrs. F. Morton & Co., Ltd., 17, Victoria-street, S.W.; goods sheds—Messrs. A. & J. Main & Co., Ltd., 31, Budge-row, E.C.; rubber sheds—Messrs. F. Morton & Co., Ltd., 17, Victoria-street, S.W. *Office of Works:* Contracts for ordinary works and repairs: Birmingham—Messrs. John Bansley & Sons, 102, Ryland-steet, Birmingham; Bristol and Avonmouth—Mr. F. Chown, Montpelier, Bristol; Cardiff—Mr. J. Thomas, Mardy-street, Cardiff; Duke of York's School, Dover—Messrs. G. H. Denne & Son, Deal; Hampton Court, Kew, and Richmond—Messrs. J. Mowlem & Co., Ltd., Grosvenor Wharf, Westminster, S.W.; Leeds—Messrs. J. Wood & Son, Bank-buildings, Hyde Park-road, Leeds; Leicester—Messrs. J. E. Johnson & Sons, Ltd., 90, High Cross-street, Leicester; Liverpool—Mr. J. Williams, 70, Collingwood-street, Liverpool: Manchester—Messrs. W. D. Scott & Co., 126, Broughton-street, Cheetham, Manchester; Newcastle-on-Tyne—Messrs. Kirk & Brown, Byker Bridge, Newcastle-on-Tyne; Nottingham—Mr. G. A Pillatt, Sherwood-street, Nottingham; Sheffield—Messrs. Ash, Son, & Biggin, Ltd., Furnival-street, Sheffield; Southampton—Avery Brothers, Staple-gardens, Winchester; Windsor—Messrs Wellman Brothers & Co., Peascod-street, Windsor; Messrs. Hollis & Sons, 59, St Leonards-road, Windsor: builders' work: erection, Board of Agriculture—Messrs. Worcester.—Theatre Royal; Mr. V. Rowe, architect, Foregate, Worcester; Messrs. Stokes Brothers, Tybridge-street, Worcester.

METROPOLITAN ASYLUMS BOARD.

At the fortnightly sitting of the Board on Saturday, amongst the matters dealt with were the following:—

Western Hospital.—The tender of Mr. M. McCarthy, of 155, King's-avenue, Clapham Park, of 1,489*l.*, was accepted for cleaning and repair work at the above hospital.

Brook Hospital.—Subject to the consent of the Local Government Board, it was decided to provide balcony accommodation on four ward pavilions at Brook Hospital at an estimated cost of 790*l.*

North-Western Hospital.—The Local Government Board, having asked to be furnished with the details of proposed expenditure on drainage works at the above hospital, the Hospitals Committee submitted a report showing that the estimate of 471*l.* 19*s.* was made up by the provision of bedpan and scalding sinks, hot-water supply to several wards, drainage and incidental work.

Disinfection of Sewage.—It was decided to ask the Greenwich Borough Council to assent to the discontinuance of the practice of treating the sewage of Brook Hospital with permanganate of potash before it enters the public sewer, as the Medical Superintendent reported that, in his opinion, the process is quite inefficient as regards any true disinfection.

METROPOLITAN WATER BOARD.

At the monthly meeting of this Board last Friday, the following matters were dealt with:—

Improvement of Supplies.—Estimates of 5,500*l.* for the improvement of the Staines reservoir, and of 5,070*l.* to improve the supply to Wimbledon, were approved.

Future Supplies.—The Works Committee brought up a recommendation to authorise them to prepare plans and estimates for the construction of a reservoir at Littleton with a capacity of 3,500 million gallons. This is part of a scheme for carrying out the new reservoirs authorised by the Boards Act of last year, the whole of which, it is estimated, would cost 3,481,900*l.* After discussion the matter was adjourned.

Chingford Reservoir Buildings.—It was decided to authorise the Works Committee to accept tenders for the erection of the proposed pumping-station, gas-producer house, and two cottages, at the Chingford Reservoir Works, the estimate for which is 548,000*l.*

LONDON COUNCILS.

Barnes.—Bexhill-road, Mortlake, and Nassau road, Barnes, are to be made up as new streets The following works are to be carried out, and application is to be made to the Local Government Board for sanction to borrow 920*l.*, the total cost of such work:—Kerbing, paving, and channelling Fanny road, Barnes, estimated cost, 263*l.*: paving Eleanor-grove, Barnes, 95*l.*; paving portion of Fitzgerald-avenue, Mortlake, 177*l.*: kerbing, paving, and channelling portion of Lonsdale road, Barnes, 188*l.*: kerbing, paving, channelling, and making up path in portion of Temple Sheen-road, Mortlake, 175*l.*: paving Earl-road, Mortlake, 50*l.* Electricity mains are to be extended at an estimated cost of 620*l.* Plans have been passed for Messrs. Cox & Taylor for the erection of four houses in Temple Sheen-road, Mortlake. Mr. G. E. Sturgis has lodged amended plans for the erection of eight houses in Gilpin-avenue.

Marylebone.—Alterations to cost 600*l.* are to be carried out at the electricity generating-station for the purpose of increasing the coal storage capacity.

Stepney.—Electricity mains are to be extended in four streets. An underground convenience is to be reconstructed at the junction of West India Dock, East India Dock, Commercial and Burdett roads, at an estimated cost of 1,350*l.* A new paving depôt in Narrow-street and Midland-street is to be provided at an estimated cost of 7,150*l.* Plans have been lodged with the London County Council by Mr. H. G. Leslie for the erection of a building at St. Boniface School, Union-street; also by Mr. H. G. Needham, for the erection of buildings in Harrison-court, Wheler street, and Quaker-street.

Tring.—The Surveyor has been authorised to proceed with the work of kerbing and channelling in Aylesbury-road.

Watford (Urban).—The tender of Messrs Bracey & Clark has been accepted, at 94*l.* 1*s.*, for carrying out drainage works at Tolpits-lane

THE QUANTITY SURVEYORS' ASSOCIATION:

ANNUAL DINNER.

THE annual dinner of the Quantity Surveyors' Association was held on Monday at the Connaught Rooms, Great Queen-street, Kingsway, W.C., the President, Mr. C. W. Ball, in the chair. There were also present the Rt. Hon. Lord Mayor of Leeds (Mr. William Nicholson), Mr. H. A. Bartlett, President of the Institute of Builders; Mr. F. G. Rice, President of the Builders' Benevolent Institution; Mr. Dudley Bartlett, President of the Builders' Clerks' Benevolent Institution; Mr. James Wright, President of the National Federation of Building Trades Employers; and Messrs.

The toast of "The King" having been honoured,

The Rt. Hon. the Lord Mayor of Leeds,
in giving the toast of "The Quantity Surveyors' Association," said he had had considerable experience of quantity surveyors, and he knew they were the best friends of contractors. There was a necessity for such an association as that of the Quantity Surveyors' Association—which he was told was in a flourishing condition—if they were to get a living wage and keep their heads above water. In the North there was a prevalent practice of the architect taking off his own quantities, and he did not think that was desirable, for in the consummation of a good building an architect, a skilled quantity surveyor, and a good contractor were wanted. He noticed that even County Councils sweated quantity surveyors, though there were municipalities which were not employing them at all. He had been fighting that question in the form of engineers *qua* architects, as he saw a great distinction between the work of the two professions. He was told that certain work could be as well done by the City Engineers as by an architect, but he thought that architectural work should be done by an architect. The proposal was rejected twice, and it was only at the third meeting that the principle was conceded. He wanted the Association to take its proper place and do its own fighting in this matter. He should like to express an opinion in regard to the work of contractors and say that he thought they must look forward to dearer prices. In both building and engineering trade had been very bad for the last three or four years, and the time had come, what with legislation, strikes, the increase in the cost and the lessened production of labour, when contractors would have to alter their prices. Contractors had in their minds certain prices which in the past had paid, but which would not pay now by 25 per cent. So when they were framing their estimates they should take into consideration that the old rates would not pay, and should make estimates that would enable them to make a good job.

The President,
in reply, said he regretted that two proposals he had made when he was elected had fallen through, *i.e.*, a conversazione and a visit to Portsmouth, where there were a good many interesting things to see. He was glad, however, that something had come of his wish that the Benevolent Fund should be put on a satisfactory basis. He asked for 46*l.*, but they had sent him 78*l.* The Council of the Association had had a busy year, and the ordinary member had no idea of the amount of work they got through; they had all kinds of communications from all sorts of people and authorities, who wanted information on almost every subject connected with surveying and the building trade generally. During the past year the Association had completed the revision of the articles of association, and the principal alteration was as to the introduction of a new class of membership, *i.e.*, the Associate, who must be twenty-two years of age, have passed the Association's examination or some corresponding similar examination, and give evidence of good training and experience. They thought the new class of members would be a success, for there were a good many young men who passed the examination who were not qualified by experience to act as fully accredited quantity surveyors at once, but after a few years of Associateship they would be qualified to become full members. The Association had passed a new by-law by which it was an offence for any member to do work under a limit of 70,000*l.* below the Association's schedule rate of charges, and they considered that was a very important matter. The Association had not issued this year another pamphlet on the standardisation of measurement, as two had already been issued. A sub-committee of the Association had been working in the matter with representatives of the Surveyors' Institution, and another meeting was to be held, and they could not say what the result would be, but the matter had been well considered, and it was hoped that the two bodies would take some joint action in the matter. The Association had a new Presidential badge, and he might mention the names upon it of the Past-Presidents, *i.e.*, Mr. Walter Lawrence, one of the founders of the Association; Mr. A. J. Gate, Mr. W. R. Hood, Mr. A. E. Harris, Mr. H. T. A. Chidgey, and Mr. Chatfeild Clarke. He was glad to say that they still had their Hon. Secretary, Mr. Cross, with them, and he should like to thank him for his valuable services. There had been considerable increase in the membership of the Association, and several leading surveyors were joining the Association, and the membership was a far-reaching one. They were doing good and useful work, and he thought they would be able to accomplish what they set out to do. When they were more firmly established and had enrolled all or nearly all the principal surveyors of the country they would be a power for good and their influence would be widespread.

Mr. H. M. Hodgson, F.S.I.,
in proposing the toast of "The Architects," said that it was their province and sometimes their unpleasant duty to criticise the architect's work on the scientific side, but on the artistic side their work was practically confined to those beautiful little sketches which adorned the margins of their bills which they sometimes used when words quite failed them to describe the full beauties of the design from which they had to take quantities; but even then the prudent surveyor added a note that these sketches were not to be regarded as details in any way, but merely rough approximate sketches put in to elucidate the text. If they had any leanings towards style it was towards the severely classical, and what they did not like was that "restlessness" in architecture of which they had heard, for it very often doubled their labour without increasing their fees. As a quantity surveyor he liked the three R's of architecture, *i.e.*, regularity, repetition, and rectangles. Fortunately, the true canons of art, he believed, required a certain symmetry and regularity in architecture, and those designs which looked most simple and regular on plan were generally those which worked out best. He had been struck by the great improvement which had taken place in the street architecture of London during the last twenty years, and that improvement was going on still. Great beauty and refinement characterised many of the buildings, which had taken the place of those which existed twenty years ago. Bricks and stucco were going down and marble and stonework were going up. Sometimes ferro-concrete buildings were put up, but he hoped they would not become too evident and that they would be decently clothed in a skin of masonry. What London would be like in fifty years' time if this improvement went on no one could say, and it was to be hoped that in that time there would be some body, on which architects would be represented, which would restrain and regulate the architecture of our streets so that there might be more uniformity and agreement. In this transitional period in the history of architecture we came across strange juxtapositions of buildings, especially as to scale, but no doubt that would right itself in the course of time. There was perhaps a tendency in the great scale of modern buildings in London to be too colossal, and the width of the streets designed for smaller buildings might not be satisfactory when the larger buildings took their place. He thought it was a very satisfactory thing that architects had been associated with the development of large building estates like those at Hampstead and Gidea Park, for that association had been entirely good, and in the course of time he hoped it would do something to change those dreadful suburbs of London with which they were acquainted. At Hampstead Garden Suburb there had been a great improvement in the way the estate had been developed.

Mr. A. W. S. Cross,
in reply, congratulated the Association on its flourishing position, and he hoped to see them extend their work and their sphere of influence. He hoped to see the day when it would be possible to exercise the principles of examination or some form of test of professional ability for quantity surveyors in the United Kingdom. In these days of competition, when it was the practice to admit all sorts into the professions he thought they would agree that the professions which were open should be closed. Quantity surveyors were indispensable to architects, especially when the builder's bill of extras loomed large on the horizon. For their associated capacity they were equally useful, because when any urgent question relating to their duties and responsibilities and to their emoluments arose architects and others appealed to them to be put right. If they started any scheme for the statutory qualification of quantity surveyors they would find immense difficulties to encounter, both from legitimate and other practitioners, but if they persevered the effect would not fail to be good to the whole profession, and architects would be glad to know that quantity surveyors were all tried and competent men.

Mr. Henry Riley (Vice-President of the Association),
in proposing the toast of "The Contractors," referred to the introduction of new types of construction and to the work of specialists, remarking that building operations daily became more difficult for the contractor.

Mr. H. Arthur Bartlett (President of the Institute of Builders),
in response, referred to the trouble of strikes, actual and threatened, and said that the building trade would not stand the increase in wages proposed by the men to meet the increased cost of living, but they hoped the present difficulties would be got over. As to the sub-contractor trouble, it was a great pity that builders were not given more discretion and given the opportunity of doing a great deal of the work of the sub-contractor. If the present tendency went on builders would have to be called builders' merchants' agents instead of builders.

Mr. S. Chatfeild Clarke, F.S.I. (Past-President),
suitably proposed the toast of "The Visitors," coupled with the name of Mr. George Corderoy, F.S.I., who hoped that that evening would be the precursor of a closer intimacy between the two bodies which represent surveyors in the country. There had been a closer approximation, and that he welcomed and had always done his best to foster. He admired the energy which the Association had devoted to professional subjects, and he hoped that the cause which they all had at heart would be advanced. There were difficulties to surmount, but there were opportunities for those who wished to advance the interests of the profession.

The last toast was that of the health of the Hon. Secretary, Mr. Cross, proposed by Mr. A. A. Hudson, K.C., who referred to the admirable work carried out by Mr. Cross on behalf of the Association. Their Hon. Secretary had the satisfaction of seeing the growth

f the society, which was very marked. Not nly had the Association grown, but it had done xcellent work, and he did not know any rofession which rendered such great assistance the lawyer as the quantity surveyors' rofession. He agreed as to fixing a minimum age, but not a maximum. The members of he architectural profession, he believed, had xed a maximum fee, which was a great istake, and no other society he knew of d so except solicitors and cabmen.

Mr. Cross suitably replied, and the proceedings on afterwards concluded.

LIGHTNING CONDUCTORS.

MR. W. T. HATCH, Engineer-in-Chief to the etropolitan Asylums Board, has submitted e following interesting Report on the whole estion of lightning conductors:—"Referring the Memorandum of March 14, 1912, in hich I was instructed to report upon the equacy and efficiency of lightning conctors generally, I would remark that the ual impression appears to be that there is a eat deal of uncertainty as to whether lightning nductors are useful or dangerous in conxion with the buildings to which they are ached. Perhaps a few words on the principle on which lightning conductors work may plain matters.

Lightning, like every other force in nature, ows the path of least resistance. Buildings trees are weaker or less resisting (electric-) than the air, therefore the lightning will through them in preference to going through air beside them; but if there be placed on se buildings paths that are electrically ker, the lightning will pass along those hs in preference to going through the ldings. A line of metal forms the weakest the least resisting path, and, therefore, prevent lightning crashing through any ding with destructive violence it is cusary to place paths of metal for it to follow call them lightning conductors, and if rtifically applied and maintained in good r they are safeguards against damage. like many other things that are simple in ry, the protection of buildings against ning is, in practice, a somewhat difficult ter, requiring considerable knowledge and rience, for the question is generally comted by there being already in and on the dings lines of metal (such as gas pipes, r pipes, guttering, etc.) which, though not owledged as such, are more or less deve lightning conductors which have to fully considered in obtaining an efficient m. A lightning conductor does not ct lightning any more than the other lines etal do, and an exposed part of a building ble to be struck whether there is a conor on it or not, the only difference being if there be an efficient conductor it will uct the flash harmlessly to earth, but if is none the flash will force its way uctively through the structure.

far as figures are available it appears that ngland 400 buildings are damaged by ing each year. Of these, about eight per n, or 2 per cent. only, have been fitted lightning conductors; the remaining cent. have not been so provided. Where ge has occurred to so-called protected ngs it has generally been found to be due to an insufficient number of conductors g been provided for the size of the building, their having been applied incorrectly; er being once fixed, to no further attention been given to them to ascertain that onnexions to earth have been maintained But with very few exceptions little ction by fire has occurred to the 2 per cent. dings protected by lightning conductors, o far as can be ascertained, no case of human life has occurred in a protected g during the last ten years, but there are us instances on record of loss of life in ected ones.

pt where lightning has been seen to a conductor without harmful effects, ly indication of a conductor having d a lightning flash is a small mark on nt, which is not easily visible. Two cases nowever, been noticed during the last connexion with the Board's institutions, he Northern Hospital administrative nd Darenth Asylum water-tower, where nts of the conductors have been found fused owing to their having received of lightning and conducted it safely to ithout any destructive effect.

I find that in the days of the London School Board there were 500 schools (many of which were loftier than the surrounding buildings) unprotected by conductors and considerable damage occurred. In one instance the school was struck and scholars were killed. This led the School Board to adopt lightning conductors throughout the whole of their system, and to have them periodically tested by an expert and kept in order. Since this precaution has been taken I understand that no damage has occurred whatever. When the School Board was taken over by the London County Council it was decided, owing to the immunity from accident by lightning, to disconnect the lightning conductors, and several were removed from some of the schools, with the result that at one school (Eltringham-street, York-road, Wandsworth), a few days after the lightning conductor had been removed, the building was struck and damaged, and on the advice of the electrical department, which had not been consulted with regard to the dismantling of the conductors, they reverted to protection again.

I find also that the Admiralty, although not protecting their iron ships (owing to these being naturally perfect lightning conductors), provide lightning conductors for chimney-shafts, naval barracks, hospitals, and other buildings. The War Department also applies them to similar buildings, as well as to explosive magazines and factories, the Home Office to prisons, and the Office of Works to all important buildings in its charge. The London County Council, besides the schools already referred to, provide lightning conductors for fire-stations, asylums, and for all tall chimney-shafts under their control.

From a financial point of view it may possibly be cheaper to repair damaged buildings struck by lightning rather than instal an efficient protective system, and in the case of an outbreak of fire during such an occurrence the complete system of fire alarms and appliances for extinguishing fire would probably be effective; but there still remains the possibility of the loss of life, and this is one which, in the case of the asylums where large numbers congregate in the recreation hall, chapel, and such-like buildings, any loss would probably be on a large scale rather than be confined to injury to an individual. I beg, therefore, strongly to recommend that the present system of periodically testing and examining the lightning conductors throughout the Board's institutions once every five years be continued, and that the recommendations as to the fuller protection of the more important buildings receive serious attention from time to time."

MAGAZINES AND REVIEWS.

IN the *Burlington Magazine* Mr. Arthur M. Hind has an article on Jacques Callot, the XVIIth-century artist, whose etchings are so admired by collectors. The illustrations of his work include a chalk study and an etching of "Paris, with the Louvre." Mr. Romney Green, who is so closely identified with the Arts and Crafts movement, continues his series of articles on the "Principles and Evolution of Furniture-Making"; he suggests that the degeneration of the craftsman into the mechanic was largely due, even before the invention of modern machinery, to the evolution of his tools and his methods. Mr. O. M. Dalton writes on the "Byzantine Enamels in Mr. Pierpont Morgan's Collection."

The *Connoisseur* contains various articles of interest to collectors, notably those on the objects of art at Carlyle House, Chelsea, on Sussex pottery, on peasants' rings. The plates include a "Portrait of Federigo Gonzaga, First Duke of Mantua," by Francia, and some illustrations in colours of porcelain knife-handles.

In the *Studio* the series of views of Old Moscow, by A. Vasnetzoff, possess a curious interest as an attempt to render the characteristics of the city in mediæval times. The work of Edmond G. Reuter, of Geneva, is both decorative and imaginative in quality. Recent designs in domestic architecture include "Old Castle, Sussex," by Mr. Ernest Newton, A.R.A.; "Claverdon Hall, Warwickshire," as altered by Mr. Arthur McKewan, and a number of competitive designs for a private laundry.

The most interesting article in the *Architectural Record* is from the pen of Otto Wagner, of Vienna; in it the author deals with numerous practical questions arising out of the development of a great city, and in considering the æsthetic aspects emphatically ranks himself with the advocates of the formal and monumental treatment of buildings. Here and there may be noted a side shot at what Professor Wagner evidently regards as the pernicious doctrines of Camillo Sitte, and he is hardly more in sympathy with the modern German and English schools responsible for the rise of the garden city and garden suburb. The article is accompanied by illustrations of some of Professor Wagner's works. The series of Early American churches is continued in this issue.

The current issue of *Concrete* contains a very clear set of illustrations of the constructional steelwork to Messrs. Nicholl & Co.'s premises in Regent-street, with descriptive notes. The article on a large building in Brunswick-street, S.E., entirely in reinforced concrete, exhibits many points of interest, and the description of the cement-gun and its uses suggests great possibilities for this method in the future, more particularly as regards the coating of steelwork in cement without the use of casings or forms.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, S.W., Lord Cheylesmore, Chairman, presiding.

LOANS.—The Finance Committee recommended that loans be made to Borough Councils as follows:—Lambeth, 700*l.* for street improvement; Poplar, 10,000*l.* for electricity buildings; Shoreditch, 10,845*l.* for electricity undertaking; and St. Marylebone, 70,000*l.* for erection of a town hall.

LEADENHALL-STREET.—The Improvements Committee recommended that, on the understanding that the Council is not thereby committed to contribute towards the cost of any further widening of Leadenhall-street, a contribution be made, on the Council's usual conditions, of one-half of the net cost of the widening of Leadenhall-street, at Nos. 57 to 69 (inclusive), proposed to be executed by the City Corporation, provided (i.) that if such net cost exceed 252,800*l.*, the Council's contribution shall be limited to 126,400*l.*, and (ii.) that in the execution of the improvement no departure whatever be made from the approved plan except with the previous sanction of the Council.

FIRE STATIONS.—Various repairs and alterations are to be carried out at the chief station at an estimated cost of 135*l.* 8s. 6d., and external painting, cleaning, and varnishing works at the fire stations of the Council, for which tenders are to be invited.

THEATRES, ETC.—The following drawings have been approved by the Theatres and Music Halls Committee:—Amherst Hall, Kingsland High-street—alterations; Ladbroke Hall, Notting-hill—alterations; Marlborough Theatre—bioscope-chamber, lobby, and rewinding room; Windsor Castle Hall, Maxey-road, Plumstead—alterations.

ALHAMBRA.—The Committee also report that drawings have been submitted by Mr. Bertie Crewe, showing proposed alterations at the Alhambra Palace of Varieties, Leicester-square. The alterations include the erection of a cinematograph-chamber at the balcony level, abolition of the pit, and rearrangement of the stalls seating, provision of a new exit, and closing up of certain exits at this level.

LEGAL COLUMN.

London Building Act.

The building line in the Euston-road has been the subject of considerable litigation, and in *Rex v.* Tribunal of Appeal a point came to the Divisional Court for decision. The Superintending Architect had fixed the building line between Hampstead-road and Osnaburgh-street, and five parties appealed to the Tribunal of Appeal. The Tribunal, having heard the parties, varied the building line as determined by the architect in some particulars. The five parties were dissatisfied with the finding, and applied for special cases to be stated. The Tribunal, having given notice to certain parties also interested, determined to state three special cases as between various parties. The London County Council applied to the Court for a rule *nisi* on the ground that under sect. 182 of the London Building Act there was only power for the Tribunal to

state one special case. The Divisional Court held that under the section the Tribunal had a discretion to state such a number of cases as they should deem advisable.

The Right to Light.

The case of Griffith *v.* Richard Clay & Sons, Ltd., briefly noted by us, February 23 last, and reported in our columns last week, on the hearing in the Court of Appeal, appears to raise a new question in connexion with the damages recoverable for an actionable interference with the right to light.

The plaintiff was the owner of two houses in Brunswick-street, Blackfriars, and it was admitted that the defendants, by erecting their new buildings, had obscured the light to certain windows in these two houses. Behind these houses there was another building, also in the ownership of the plaintiff, but separately rated and having no windows looking towards the defendants' buildings. The total surface area of the two houses was 1,000 sq. ft., the surface area of the third house was 1,050 sq. ft. The defendants admitted obscuration to the windows of the two houses, and had paid 150*l.* into Court. The Judge in the Court below found that this would have been sufficient damages if the two houses alone had to be regarded, but the plaintiff contended that as the buildings, which were dilapidated, could be pulled down and one large building be erected upon the whole site, the damage to the site as a whole should be regarded, and the Court accepted this view, and assessed the damages at 200*l.* On the appeal it was contended that the damage to the dominant tenement could only be considered; but the Court of Appeal, without calling upon the respondents' Counsel to argue the case, decided in the respondents' favour that the damage to the whole site must be regarded. The point involved seems not to have been dealt with in the text-books, and raises considerations of considerable difficulty. It is clear that the only claim to light could be based on the light coming through the windows of the two houses facing the defendants' premises. Without a window there can be no easement. It would also be limited to light so enjoyed: "The purpose for which a person may desire to use a particular room or building in future does not either enlarge or diminish the easement which he has acquired" (per Lord Lindley in Colls *v.* Home and Colonial Stores). In Colls' case it was also held that such a diminution of light must be proved as to amount to a nuisance. The difficulty in the case under consideration would, therefore, seem to be a difficulty in proving nuisance in the case of a building which, at the time the action was brought, enjoyed no light from windows looking towards the servient tenement. The light enjoyed through existing windows of these old and low buildings would seem to be likely to make little difference to a large building to be erected on a site more than double the size of that the houses were built upon, yet, as we have shown above, the new building could claim no more light than the old buildings. Therefore the damage to the whole site as distinguished from the old houses would seem to be both remote and very slight. In the Court of Appeal the Lords Justices had regard to the fact that although in this case the time had elapsed within which an injunction could be applied for, the buildings complained of having been completed; yet had proceedings been taken in time and an injunction granted, that injunction would have protected the whole site. That may be so, for if a right is infringed, and the infringement can be restrained by injunction, the Courts cannot be careful to inquire whether or not incidental advantages may accrue from the injunction; but it is otherwise in the case of damages, where exact proof is required as to the injury sustained.

Possibly the present decision may be explained when it is considered that the Judge of the Court below had assessed the damages, an assessment which the Court of Appeal will rarely upset if it is shown that any claim to damages can be supported in law; but it must be confessed that it seems to import a new principle, and it is likely that more will be heard of this point in future cases.

LAW REPORTS.

COURT OF APPEAL.

(Before Lords Justices VAUGHAN WILLIAMS, FLETCHER MOULTON, and FARWELL.)

Case under the London Building Act: Minturn *v.* Barry.

THIS case was heard last week upon the appeal of the plaintiff from a judgment of a Divisional Court of King's Bench, consisting of Justices Bankes and Lush.

In this case the plaintiff, Miss Minturn, was the freeholder of a house known as 14, Chelsea-embankment, which she had acquired some years ago. About the time that she had acquired the house she discovered that a wall at the rear of her house was very damp, and her endeavours to remedy that failing, and finding that the dampness caused injury to the health of her servants, she then served a party-wall notice upon the defendant, Sir John Wolfe-Barry, the adjoining owner, under sect. 88 of the London Building Act, the notice expressing the wish to excavate on the defendant's side to try and remedy the defect by putting in some impervious material. It was alleged that the wet came in on the defendant's side. The case then went in the ordinary course under the Act to two surveyors, and the two referred it to a third, and from the decision of the third surveyor the plaintiff appealed to the County Court Judge sitting at Brompton, there being a right of appeal under the London Building Act. In the County Court the defendant took the objection that the wall could not be held to be defective merely because of damp, and the County Court Judge so decided. From that decision the plaintiff appealed to the Divisional Court, where it was held that a party wall could be defective because of damp within the meaning of the London Building Act, and the case was remitted to the County Court for retrial. The County Court Judge retried the case upon the facts, and, following some remarks made by the Judges in the Divisional Court upon the question whether the plaintiff ought to be allowed to execute work upon the adjoining owner's side, the County Court Judge held that the previous history of the wall might be gone into. He then went into the history of the wall, when he found that originally the plaintiff's party wall was erected upon the top or embodied part of the old garden wall. He said that if a building owner chose to make use of a wall such as a garden wall, which must have been quite sufficient for the purposes of a garden wall, he could not complain and say afterwards it was damp and defective, and that he could go on the building owner's side and remedy that defect. His Honour then made an order by which the plaintiff was precluded from going on the defendant's side of the wall and doing something which the plaintiff alleged it was impossible for her to do on her side. From this decision the plaintiff appealed to the Divisional Court, composed of Justices Bankes and Lush, and, her appeal being dismissed, the plaintiff now appealed.

At the conclusion of the arguments Lord Justice Vaughan Williams, in giving judgment, said the sole question for the Court to decide was whether in the circumstances there ought to be a new trial. He was of opinion, and the Court was of opinion, that the County Court Judge took into consideration matters which he ought not to have taken into consideration in arriving at his judgment. It was clear that the County Court Judge did take into consideration matters of ancient history with regard to the wall in question. As there was to be a new trial he did not propose to deal with the evidence or the facts of the case in any way, because it might prejudice the new trial.

Lord Justice Moulton concurred. He thought that the greater part of the discussion in that Court had been upon points which did not affect their judgment. The London Building Act contained provisions which enabled party structures to be repaired and made good by the person owning the house and premises, of which the party structure formed part. The conditions under which those rights were to be exercised depended upon the condition of the party wall and the arrangement of the premises on the side. But the provisions of the Act had no relation to any question as to behaviour in the past, but their object was for the purpose of giving a remedy for a present evil. The language of the Act made it quite clear that the Tribunal, which had to decide these matters between the building owner and the adjoining owner, was composed of surveyors, and if there was a difference of opinion by the County Court Judge. He was of opinion that the surveyors and the County Court Judge, upon such a matter, had no right to inquire in any way how the wall in question got into the condition in which it was and as to whose fault it was previously. What the Tribunal had to decide was the way in which the work could be carried out so as to cause as little inconvenience as possible. Beyond that they had no business to inquire into anything. His Lordship was clearly of opinion that the learned County Court Judge had thought that the questions which arose under the sections of the Act were affected by the past history of the wall; by the fact that the wall had been a garden wall and had been adopted as a party wall. It was clear, according to his view, that the County Court Judge thought that the wall had formerly water in it, and that if the plaintiff wanted to do anything to prevent the water coming into it she must do it on her own side. The County Court Judge had no business to go into the past history of the wall. He thought that in the circumstances there must be a new trial.

Lord Justice Farwell delivered judgment to the same effect, and the appeal was accordingly allowed, the costs of the appeal to the Divisional Court and to the Court of Appeal being awarded to the plaintiff, and the costs of the previous trials in the County Court being ordered to abide the result of the third trial.

Sir A. Cripps, K.C., Mr. Hudson, K.C., and Mr. Cecil Walsh appeared for the appellant; and Mr. J. R. Atkin, K.C., and Mr. Bliss for the respondent.

Case under the London Building Act: Work to a Shop Roof.

A DECISION under the London Building Act, 1894, was given at the Greenwich Police-court on the 9th inst. by Mr. Symmons on a case brought before him by the District Surveyor for Deptford, Mr. B. Greig. The facts were that Mr. F. C. Robertson, builder, of Goodwood-road, Deptford, had stripped off the zinc external covering of the roof of a projecting shop at No. 120, High-street, Deptford, and in place thereof had covered the roof with tarred felt. The whole of the projecting shop roof had been so treated with the exception of a portion occupied by a skylight. No notice of the work had been served on the District Surveyor, and the defendant contended that notice was not necessary, as the work was intended to be temporary. At the date of the hearing the work had been completed some five weeks. The District Surveyor relied on the provisions of sect. 145 of the London Building Act, 1894, which requires that where a building or structure or work is about to be commenced notice shall be served, and contended that as the work done involved the rules of the Act with regard to roof coverings, the duty was imposed on him of securing compliance with such rules. He argued that the defence as to the work being temporary was not material in the case.

The magistrate decided that notice of the work should have been served, and fined defendant 1s. and 12s. costs.

The above decision is especially interesting in view of the case mentioned in the *Builder* of April 5 and 12 last (see pages 409 and 436).

FOREIGN AND COLONIAL.

Prisons, Bulgaria.

The *Zentral Anzeiger für das öffentliche Lieferungswesen* (Vienna) of April 25 states that the Bulgarian legislative authority recently voted a sum of 2,600,000 francs (104,000*l.*) for the purpose of erecting prisons at Rustchuk, Varna, Plevna, Stara Zagora, Vratza, and Küstendil. The erection of the buildings will be begun next year, and it is expected that they will be completed in 1917.

The Building Trade in Amsterdam.

Mr. W. A. Churchill, British Consul at Amsterdam, reports great activity in the building trade during 1911, and the probability of this activity continuing during the next two or three years. There has, in fact, the Consul continues, never been so much building in Amsterdam at one time. A new Stock Exchange, large shops, offices, and residences, buildings are in course of erection, and there is a project to build a new Royal palace. The activity will produce a demand for considerable quantities of building materials, furniture, sanitary engineering, heating and illuminating appliances, etc.

Building in the Argentine Republic.

The *Boletin Oficial* of April 10 publishes a law (No. 8,881) whereby the executive authorities are authorised to give out to contract the construction of a building for the Ministry of Agriculture and for all the offices belonging to that Department. The sum of 5,000,000 pesos currency (about 437,500*l.*).

Town Hall, Craijova, Roumania.

The *Zentral Anzeiger für das öffentliche Lieferungswesen* (Vienna) of May 2 notes that the municipal authorities of Craijova have decided to erect a new town hall in that city at a cost of 1,500,000 lei (52,000*l.*).

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xvi.; Auction Sales, xxii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

IS OPENED PROVISIONALLY.

POINTS OF MERIT:

Favourable Situation.

Immingham Dock is geographically the most central coal port for the Continent, and is in direct rail communication with the great coalfields of the West Riding and South Yorkshire, Derbyshire, Nottinghamshire, &c

Always Accessible.

Immingham Dock has a storm-protected harbour and deep water channel and entrance lock, enabling the largest ships to enter and leave at any state of the tide.

Most Modern Equipment.

Immingham Dock has eight coal hoists capable of shipping 5,600 tons per hour.
Largest ships can bunker at deep water jetty only ten miles from the open sea at any time of the day or night.
Storage accommodation is provided for 11,600 loaded wagons, and there are 170 miles of sidings.
Every precaution taken to minimise breakage of coal.
Movable hoist enables two "holds" of a vessel to be loaded simultaneously.

Low Dock Charges.

Immingham Dock charges are more favourable than at any competitive port.

For Information apply Great Central Goods Agents or Port Master, Immingham Dock, Grimsby. Illustrated Brochure "3" and Map "3," printed in English, French or German, post free from G.C.R. Publicity Office 216, Marylebone Road, London, N.W.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary or artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for competition should bear the owner's name and address either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

PRIZE D.—Illustrations of the First Premiated Design in the important architectural competition will always be required for publication by the Editor, whether they have been formally asked for or not

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than* 6 p.m. *on Wednesday.* [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100*l.* unless in some exceptional cases and for special reasons.]

*Denotes *accepted.* †Denotes *provisionally accepted.*

(From *Römische Veduten*. See p. 631.)

REMOVAL AND RECONSTRUCTION.

WE are certainly beginning to put a higher value on works of recognised architectural quality, h though our appreciation is still ordinated to our sense of economic commercial demands. Temple Bar in its day an isolated case of reconction, but Crosby Hall bids fair to he forerunner of a number of schemes the re-erection of buildings the re destruction of which would be ittedly a national loss.

/e should be the last to advocate the oval of a fine piece of architecture n the position for which it was origin- designed, and we are convinced that s have often occurred where a good ding has been destroyed which might have been preserved. There are, ever, instances where the imperative essities of the civic organisation dictate removal of old buildings or interest- monuments, and in such instances it should be our recognised policy to reconstruct these in positions equally if not more suitable in respect to environment. This may sound like a counsel of perfection, considering that we are hardly in a position to congratulate ourselves on our efforts to place even our new buildings and monuments; but unquestionably we ought to be qualified to provide suitable settings meeting all the artistic and the psychological demands either for new or old. It should be a part of the *métier* of the artist, and the solution of such a problem is indeed often within his powers if he, perchance, were allowed a voice in the matter. As, however, we seem to regard everyone else as better qualified than the artist to decide these matters for us, it is hardly surprising that a satisfactory result is so rarely arrived at, and that from our present system, which fails in the majority of cases, we are not very likely to evolve the means of dealing satisfactorily in the matter of reconstruction. The Briton's ignorance of his ignorance in questions of art is responsible for this, as for many other happenings that bring despair to the artist.

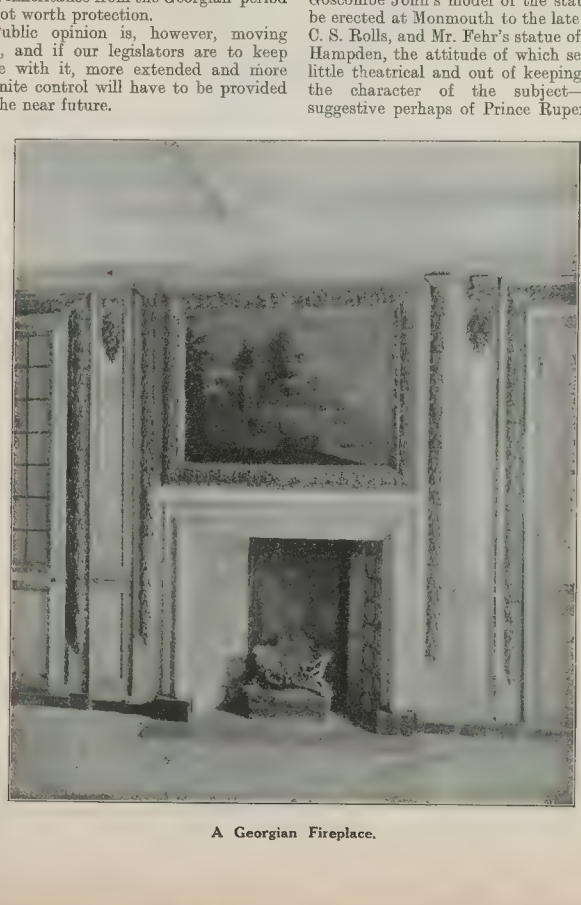
Now and again an important case of demolition comes before the public, and columns of discussion appear on Crosby Hall or Tattershall Castle, but quietly and unobtrusively the art dealer dismantles many a charming old mansion without attracting the attention of the public. Maybe the house lies rather too low for the modern squire, who orders his fish from London or Grimsby, and does not feel the need of a fishpond within a hundred yards of his kitchen; or, maybe, the drive of 6 miles from the nearest station is not balanced by corresponding advantages in the way of hunting or shooting. At all events, the house is found to be unpopular and almost unlettable. What more natural than that

the carved mantels, rich panelling, and graceful staircase should be extracted for the purpose of imparting the charm of antiquity to some more commodious or accessible residence?

Numerous instances of such a procedure have come to our knowledge, and only a short time back we received illustrated particulars of a dignified old Georgian house from which a purchaser could obtain the whole of the interior woodwork and fittings, if he preferred such a course to that of purchasing and retaining the house as it stood. Photographs (one of which we reproduce) showed the quality of the work, and it is evident that the vendors regarded it as most probable that the house would be gutted and its contents utilised elsewhere.

This is by no means an isolated case, and there is at present no means of checking a practice that it is difficult to look upon with equanimity. We may hope for something from the Bills now before Parliament and in course of being considered by a Joint Committee of the Lords and Commons; but even these are not so drafted as to give definite security. We have already referred to their tentative character in regard to the handling of private property, while the instruction to the Royal Commission on Ancient Monuments to confine their investigations to works over two hundred years old has tended to give the impression that our rich inheritance from the Georgian period is not worth protection.

Public opinion is, however, moving fast, and if our legislators are to keep pace with it, more extended and more definite control will have to be provided in the near future.



SCULPTURE AT THE ROYAL ACADEMY.

OWING to the way in which the sculpture is arranged — due in the first instance no doubt to the inadequate space devoted to it—it is even more difficult than in the case of the paintings to arrive at any just appreciation of its qualities.

From the architectural point of view, moreover, all works of sculpture need to be related to their environment. It is difficult to judge them in space. Although by the necessary limitations of any exhibition it may be impossible in most cases to suggest this environment, at least open-air statues might have their pedestals, which, after all, are as necessary to the effect of the whole composition as the figures themselves.

The Central Hall contains the usual number of memorial statues ranged against the wall at the wrong height from the ground. Here we get Mr. John Tweed's model of the bronze statue of Lord Clive to be erected in Whitehall. So far as we can judge, the figure looks rather clumsy, heavy, and uninteresting, but possibly when seen in relation to the architecture of the offices of the Local Government Board this effect may disappear.

In the same room we find Sir W. Goscombe John's model of the statue to be erected at Monmouth to the late Hon. C. S. Rolls, and Mr. Fehr's statue of John Hampden, the attitude of which seems a little theatrical and out of keeping with the character of the subject—more suggestive perhaps of Prince Rupert.

A Georgian Fireplace.

The late Maharajah of Mysore b Mr. Colton, Lord Curzon by M Pomeroy, and Thomas Gainsborough b Mr. Mackennal are different treatmen of single figures in which the architec finds it difficult to take much intere without knowing where they are to b placed and how they will be completed while the two charming models by M Henry Pegram for Oriel College, Oxfor seem to suffer somewhat from th awkward shape of the niches in whic they are to be placed.

Mr. Albert Hodge sends two imagina tive groups, of which we prefer the "Bo and Vulture," and Mr. Gilbert Bay exhibits "The Fountain of the Valkyrs —executed in bronze, marble, an mosaic—an interesting work which, how ever, does not convince us entirely.

The centre of the room is occupied b a group by Sir George Frampton entitle "Protection," but, being only a portio of a memorial to be erected to the la Dr. Barnardo, our interest is again limite by this fact. Of greater importance, b being more complete, are the variou scale models for statues or memorials o the late King, of which that by M Derwent Wood is, in our judgment, th most satisfactory.

We venture to suggest that, if it impossible to allow sufficient space t display full-sized models in a prope manner, it would be much better all exhibitors were restricted to suc sketch models as these. This woul enable the intentions of the designs t be better realised and the artists to b judged as artists, and not simply a modellers.

The model of the London Memorial t King Edward VII. is a case in point being far more interesting than would b a full-size model of one of the group This work is described in the catalogu as by "Bertram Mackennal, A.," "th architecture by Edwin L. Lutyens." Considering that this is a case in whic the architecture predominates and deter mines the general size and shape of th monument, this description might wel have been reversed, if the equal associa tion of two names in collaboration wa not thought to be sufficiently explicit.

It is much to be regretted that thi important work is not more satisfactory What one feels is that, although an archi tect and a sculptor have been associated together in its production, they hav achieved no real unity of conception Considering how little training or experi ence either our architects or our sculptor have had in collaborating in this class o work, it is only what might perhaps b expected. It is all to the good, however that the public has at last recognised tha they should collaborate. This, at any rate, is something for which to b thankful.

The recumbent bronze effigy of th late Marquess of Salisbury for th Salisbury Chapel at Hatfield, by Si W. Goscombe John, is another design into which a distinct architectura element should enter. We cannot help feeling, however, that in this respect it i not altogether a success. It is a delicat and workmanlike piece of work, but i seems to be lacking in simplicity an severity of treatment. The arrangemen of the drapery at the feet of the effig

seems rather weak and confused, and does not appear to balance the general composition in so satisfactory a manner as does the helmet or crest beneath the feet, so usual in mediæval monuments of this description.

Among the large number of portrait busts arranged round the wall the most noticeable perhaps is that of the late Lord Collins, Master of the Rolls, by Mr. F. Derwent Wood. This work attracts attention by its striking subject, and keeps it by the fine way in which this subject is handled.

Of quite unusual interest is the wax statue of Thyrsis, by Mr. J. Havard Thomas. This is a thing apart. Of intellectual rather than emotional power, its purely sculptural qualities seem to place it on altogether a different and perhaps higher plane than that on which most contemporary work now stands.

Whatever may be said of the exhibition as a whole, the sculpture, like the painting, is not lacking in works of individual distinction.

NOTES.

The London Society and Public Opinion.

THE report of the inaugural meeting of the London Society * is pleasant reading for the lover of the city beautiful; but those of our readers who noticed a report of the meeting in the daily Press of the 24th inst. had probably seen the letter in the *Builder* of the same date from Mr. W. A. Haskins, stating the underlying reasons for the Piccadilly fiasco, where surely was an opportunity lost—lost as many others that come to mind in a mournful series, from the plan of Sir Christopher Wren for the rebuilding of the City after the Great Fire down to the Aldwych and Kingsway schemes, and the discreditable squabbles of last year about the termination of the Processional Way—because the conflicting interests concerned were greater than the powers behind the artist. The Piccadilly affair is, in a way, unique, for in this case the tenants were willing to concede more than in most cases, but were naturally bound by business interests, and the matter furnished a striking example of the ease with which the best intentions may be frustrated through unforeseen, but not on that account less formidable, obstacles. With no desire to damp the enthusiasm of the new Society it might be well to consider the present position, and to take stock of the forces which have to be reckoned with, forces which are not new, but nevertheless reasonable, and it is here that the lover of the city beautiful has good grounds for despondency and even more—despair. He considers, as the London Society considers, the public as the arbiter, and he considers the public sympathetically; but, at the same time, it must be confessed that the vast majority of the people are exasperatingly indifferent to their surroundings.

Beauty and Utility.

THEN, again, the question arises of personal interest, mostly pecuniary; and there is the age-old conflict between beauty and utility in a new guise. The magnificent schemes for the cities of the future have a marked tendency to set aside the shopkeepers' desire for self-advertisement, which last, however, is only really the product of our swiftly moving times; and, as it is the shopkeeper who pays, who shall deny his right to dictate his requirements? A recent instance discussed in these columns has shown the strong feeling which exists on this matter, and it must be confessed that the clear and just demands of the trader have been rather set aside by the profession. Again, the local authorities, with their cast-iron regulations of yesterday, and the sanitary bodies, must be considered, and a final obstacle, one which the London Society points out, is that, in any public scheme where the people's money is used, the guardians of the public purse would hesitate to spend large sums without public approval and support, and this brings us back to the popular view once more and to the real root of the matter. It may be fairly said that the greatest difficulties arise from lack of education in the higher duties of citizenship, and it is rather a question of time, for with a more enlightened view of civic duty greater harmony will accrue—harmony which will not only rule our affairs but also our buildings, and the individual will not, it is hoped, be suppressed, but rather induced to come into line with his neighbours. This question of time is the key to the problem—the more workers the shorter the time and the more rapid the spread of the knowledge of the higher citizenship, and for this reason the London Society may be most heartily welcomed. In view of the examples mentioned above it may be said that its advent is not too soon. May it prosper! And may it lead us out of the present turmoil of petty interests into the calmer life of a united community, working together for the one end of the enthronement of art once more amongst the gods that rule our daily life.

The Old Town Hall Façade, Manchester.

THE first site selected for the rebuilding of the old Town Hall façade having provoked opposition, the Parks Committee has now decided to find a position in Heaton Park. A Manchester architect, in protesting against the re-erection, argues that it is a waste of money to maintain a building the details of which any student can copy from a text-book, and doubts whether it is feasible to make a mere façade look possible from other points of view. With the first of these arguments we find it impossible to sympathise. Our great cities are not so well provided with examples of refined and scholarly architecture that we can afford to lose one when it can be saved; moreover, the advantage of having such an example before our eyes in the course of our daily life is incomparable with that of being able to refer to accurately-drawn detail in a text-book. What architect would not find himself far more inspired in his work if he were constantly surrounded with the finest types of architecture, and who would exchange such a possibility for even the best-appointed library?

Façade or Building?

THE other contention has a sounder basis—a façade without a building behind it cannot be entirely satisfactory even if some means are taken to screen the ends. It would be far better to find some demand for accommodation suited to the design and to provide a building in character with the façade. Another difficulty will have to be met; a design made for a city street would look out of place in a park unless the surrounding areas are most carefully studied and judiciously laid out on markedly formal lines. The proportions of the building in question are fortunately such that with a well-defined *place* or avenue in front its effect would be satisfactory, but if it were dumped down haphazard the result might only provoke adverse criticism and discourage similar action in future cases.

Liverpool Custom House.

THE long foreseen problem of a fine new Custom House for the first port in the kingdom is at last being definitely raised. It is a problem even now, we believe, almost in the "vexed" stage in the city concerned, and we see a fine crop of difficulties ahead and a doubtful issue. The old Custom House—a gaunt, inconvenient, but not undistinguished building and a landmark from the river, was built exactly on the fitting site: that is to say, on the brink of the nucleus dock and harbour, and balancing the other symbol of the city's dignity, the Town Hall, at the other end of Castle-street, then the backbone of the town. Now the axis has swivelled round, and Dale-street, with the Town Hall as fulcrum, has become what Castle-street used to be. The harbour, to which a Custom House should have direct reference, is also very much other than it was. Instead of consisting of the Pool, Salthouse Dock, and the old basins adjacent, it embraces the whole river front and the docks on the other side. The estuary of the Mersey itself, that is to say, is now required to do what the Pool once did. Our Custom House, then, must be emphatically on the river bank. It might also, not unfitly, be upon that axial thoroughfare upon which the whole city hinges and on which the Town Hall stands. And there happens to be a site which complies with both these requirements. Upon this site, by an instinctive process perhaps rather than through the train of thought indicated above, the majority of Liverpolitans have fixed.

Lack-of-Forethought's Legacy.

AND, apart from the question of cost, at present troublesome, but doubtless to be surmounted, all would seem to be well. But this site is the central one of three formed on an emptied dock. The roadway round about, Man Island geographically (the riverside being called Pier-head—main access to the great landing stage) is virtually the one point at which the land comes to the edge of the water, if we may so express it, there being but dock walls and gates for several miles on either hand. On this land there should naturally be assembled the significant riverside buildings of the city. One is already there, the great offices of the

* See p. 627, this week.

Docks and Harbour Board—a building somewhat in the style of the War Office in Whitehall, but with a gracious dome in the middle on the southernmost site. It was there first; it is not very tall; it does not hopelessly outscale the city behind. All the land belonged to those who built it; and yet in a few years there arose on the northern site the nearest approach to a skyscraper that we have in this country, a great commercial building. It dwarfs the city and it dwarfs the Dock Office, dome notwithstanding. It was said at the beginning that the Pier-head and everything just behind it should have been treated as a whole. Everyone more and more is beginning to realise why. It is not yet quite too late to make something tolerable of the wreckage of a great opportunity. Would that those responsible for the initial small-minded short-sightedness could be sentenced to confinement until they contrived a reasonable solution!

AMERICAN COLLEGIATE ARCHITECTURE.

THE impression one receives from the collection of drawings and photographs at Conduit-street is, on the whole, one of disappointment. Perhaps also because we are becoming accustomed to feeling, on approaching a consideration of work in America, that we are about to find ourselves once again in many directions rather hopelessly "out done" the exhibition affords a light tincture of relief. It is a little selfish, that view, not quite so altruistic or so disinterestedly anxious for the welfare of architecture, broadly speaking, as we would like to think of ourselves as always being, and as we certainly usually profess to be, but it is natural enough. We see the results of the free opportunities of our cousins and of the munificence of clients, and perhaps we are apt, at this distance, to underrate their difficulties, the multiplicity of unprecedented needs they have to meet, and the highly organised speed with which all has to be accomplished. Be this as it may, certain it is that we do not underrate their ability. And no one will be able to gather reason from the work under discussion for lowering that estimate. We are shown many photographs (hard, cruel things) and drawings, and especially must we note some plans, block plans, of the general "lay-out" of some of the newer seats of learning. The work of Messrs. Cram, Goodhue, & Ferguson is chiefly in evidence, supported by exhibits from Messrs. Maginnis & Walsh, Messrs. Day Brothers & Klauder, and Messrs. Cope & Stewardson. Nearly all of it illustrates one clear tendency and aspiration. And that aspiration is the planting in the United States of something of the unrivalled charm of our own old colleges in Oxford and Cambridge. The style attempted is, for the most part, what we call "collegiate." Even here, in an old country, not too bright, and damp enough soon to remove the "raw edge" from what we do—even here, and executed by past masters in its peculiar manner, men in whom it is the breath of life—attempts at addition and resuscitation are, at the best, doubtful and always exceedingly difficult. We do not wish to press the point of rivalry. In this, if in any field, we have a clear advantage. Photograph for photograph, the work shown is, in itself, as good as ours. But the mode depends so much on adventitious co-operation. Weathering and lichen, association and the historic sense, the odour of antiquity and the sweet breath of immemorial seclusion, combine and work together to endow the style, with a charm that the craftiest handled stone itself can never give. Which is but to instance an item in the battery of argument against "revivals"—as though there ever could really be such things. We here are becoming agreed upon that point after our century of attempts—the hottest fights of which our older men can easily remember—some to remain silent, but working according to the old lamps, seemingly undismayed. Among these, in so far as he is working and undismayed, although by no means silent, Mr. Ralph Adams Cram—of whose vivid address at the R.I.B.A. recently the drawings are exhibited as illustrations—consciously ranks himself. He has threshed his standpoint out to something of a philosophy. It is, perhaps, the philosophy of those who in this country are his brethren, but left on a part of the field over which the battle has swept and passed. But with Mr. Cram and those on his side in America this issue is not yet decided. Having a more arrogant modernity against him he has need to be articulate and certain of his standpoint. Briefly, it seems to come to this: "We know that what we are doing is not perfect, but, in view of the aim of our building, it is what should be attempted. Our theme is traditional and serious, and our building and its appearance shall be also traditional and serious. We will guard the flame of the lamp we have till the dawn of a better day." Well, we are grateful for so definite a statement of principle, if only by contrast to the vagueness and very leaky thinking of which we become so tired. But we are inclined to question that flame. Not its reality, for it is genuine enough. But to wonder whether or not it is the right flame to preserve—that one, or any other indeed. For we remember many a dawn which became apparent only on a final extinction of the lamp.

But a hint of the dawn is apparent here despite the flame. There is, after all, something we have to learn; one aspect in which we are, as we suspected, hopelessly "outdone." Perhaps it is not our fault; our country is too small, too old, too keenly possessed, and too minutely divided, and so we have not the large way of planning. There are plans in this exhibition—plans of grouping and general disposition, plans of the scheme, in a word—showing a power of ranking and assembling buildings beyond anything we can do, or at least obtain the opportunity of doing. The ground plan of Princeton being, we gather, a scheme half made up of buildings erected before its conception, is masterly indeed. We especially note Messrs. Maginnis & Walsh's competitive plan for Boston College. In such work as this we think there is sign of dawn enough.

THE NEW ENGLISH ART CLUB.

THERE are few things in the way of pictures which indicate more the rapidity of the intellectual movements of modern times than the present exhibition of the New English Art Club, which was opened to the public last Tuesday. Time was when the artists of this particular coterie were the "bloods" of their day; they were young, enterprising, certainly intelligent, dead up against what was then styled Philistinism (how antiquated the term sounds now!), eager to influence and educate opinion. They performed brilliant spade-work; it is not too much to say that these young people of the Victorian nineties were the pioneers in paint of points of view which to-day largely prevail. They had their *confrères* in literary criticism, romantic literature, poetry, music, and in architecture, although architecture was perhaps less drawn into the swim than the other arts.

The curious thing about the present exhibition is that the New English Art Club does not seem to have developed under its own influences; that while it helped to promote the forward movement it remains pretty much where it was—it bears even the signs of middle age. We have, for instance, always the greatest respect for the work of Mr. William Rothenstein, but we doubt that his portrait group of three children in fancy-dress, entitled "The Princess Badroulbadour," is equal to the production of his early years. Mr. Walter Sickert, on the other hand, in his interesting garden scene, "Le Champ du Père-Denière," would seem to be carrying many years of experiment to a successful issue. His methods, largely derived from the French impressionists, have matured into a mastery which is both individual and original. A seasoned academician like Mr. Sargent, strangely enough, in his present tentative humour, fits in more appropriately with the earlier spirit of the New English Art Club than most of its present members. Mr. Sargent is obviously seeking rejuvenation in the getting away from the type of work which has made him famous. His two pictures, "Reconnoitring" and "Falbalas," are technically brilliant, but otherwise inconclusive performances indicating a questioning state of mind rather than a definite outlook. There is no hesitation about Mr. William Orpen's methods (we might sometimes wish that there were). His "Café Royal," with its many portraits, is skilful in a certain garish and bizarre way; but it is all a little overdone and caricaturish, as probably it is meant to be. There are a large number of works by Mr. Lucien Pissarro, who is consistent in his manipulation of the positive arrangement of colours, obtaining pretty much the same sort of result that is obtained by old-fashioned samplers in wool. Mr. Wilson Steer is now apparently seeking for other effects than vivid luminosity, the play of brilliant sunlight on verdant foliage and spaces, characteristic of his work a little while ago. His "Woodland Scene," a fine tangle of forest, is not thrown into violent relief by any scheme of contrasting light; the picture is probably a direct transcript from Nature in comparatively a somewhat opaque mood. Mr. C. J. Holmes views landscape in a certain spacious decorative aspect; he is more concerned with distinguishing outlines and large planes of colour than with matters of detail. Mr. Philip Connard and Mrs. Betty Fagan show two accomplished studies of flowers; but the first painter's "Castle Acre," a ruin with figures in the foreground, is a posed and artificial affair and does some injustice to his undeniable talent, which is independent of photographic expressions of this kind. Among other outstanding works are Mr. Shackleton's "Landing of the Cod-fish," painted in the light tones adopted by this artist, and Mr. Von Glehn's "New England," which contains the façade of an old frame house and which is a vigorous essay in composition.

The exhibition contains a large number of sketches, numerous etchings, and some water-colours. Mr. Albert Rothenstein is frankly decadent, somewhat after the Beardsley manner, but without Beardsley's decorative quality. From an architectural point of view, the etchings, sketches, and oil-paintings of Mr. C. M. Pearce are the most interesting in the galleries; whether he is dealing with buildings of some architectural importance or those of a merely picturesque kind, he shows definite knowledge of the scale, proportion and detail of his subject. There are drawings of buildings by other artists, however, which indicate a lamentable deficiency even in an elementary knowledge of architecture.

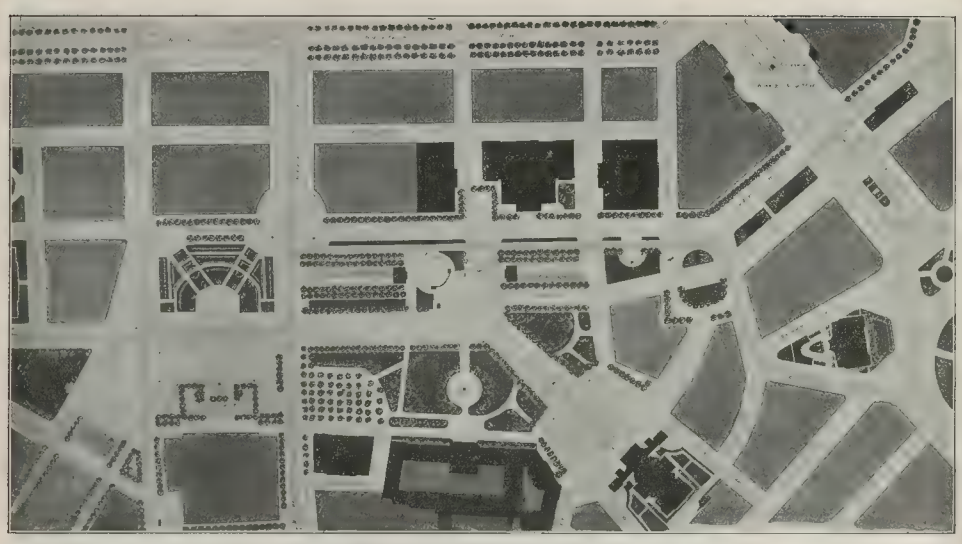
DIÉ CATHEDRAL, FRANCE.

We learn that a fire has done considerable injury to the interior of this church, in the Department of the Drôme, in the South of France, which is classified as one of "les monuments historiques de France." The flames, in the night of May 16, destroyed the high altar, with the adjacent XIIth century portique and tabernacle, and the doorway, remarkable for its old sculpture.

Parish Church, Zlonic: Restored by Professor Friedrich Ohmann.

From *Friedrich Ohmann* (Anton Schroll & Co., Vienna).

CONTEMPORARY ARCHITECTS AND THEIR WORK:



FRIEDRICH OHMANN.

PROFESSOR OHMANN'S reputation as architect has at the present time penetrated far beyond the confines of Austria, and those who have followed the development of Austrian architecture during the last decade will readily acknowledge Ohmann to be its most individual exponent. Just as Austrian art, and more especially architecture, is entitled to a place of honour in the history of art, so we must accord to the artist, Friedrich Ohmann, his share of fame amongst the artistic personalities of our time.

Born on December 21, 1858, in Lemberg, in a Germano-Austrian family attached to the Civil Service, Ohmann displayed as a boy a remarkable talent for drawing, and at the termination of his school course he entered the Vienna Technical High School, where he became a pupil of Karl König, and later studied mediæval architecture under Friedrich Schmidt in the Academy of Plastic Arts.

His next move was to Holland, where he, together with John Groll, won the first prize in the competition for a design for the Amsterdam Bourse. Returning to Vienna, he became the assistant of Karl König at the Technical High School, and through this he obtained the post of Professor of Decorative Architecture at the Industrial School of Art in Prague.

To him Prague owes a series of fine creations, and it is significant that our artist, inspired on the one hand by his historical training, on the other by the influence on his poetic mind of this artistic centre, produced works in mediæval and in baroque style remarkable for their invariable feeling for style, for their interesting and definite conception, and for the extreme delicacy of detail. We may mention as examples the Gothic Stork House, the Eagle House, and the Reichenberg Museum (in the German Renaissance style), and more particularly the Museum in Magdeburg. In the case of the latter building Ohmann did full justice to his commission by the ingenious manner in which he laid out the ground plan and adopted in each separate part of the

Plan for the Revision of the Karls-Platz, Vienna.

By Professor Friedrich Ohmann.

building the architectural expression belonging to the special period to which the objects exhibited therein belonged.

To his Prague period belong more especially such important examples of the baroque style as his Valtera Palace, the Variety Theatre, the restorations of the Parish Church of Zlonic (see illustrations) and of that at Prestic, and carried out with remarkable judgment, the improvements to the Church of the Trinity in Prague, the ballroom of Prince Clary's Garden Pavilion at Teplitz, and the restoration of the same nobleman's mountain castle, also in Teplitz.

To the Prague period belong also a remarkable group of plans—for instance, the competitive design for the German Casino, the plans for the Savings Bank in Troppau, which carried off the first prize, and more especially those for the Prague Exchange and Mart and for the General Insurance Office, in which Ohmann proved himself to be a complete master of the late Renaissance style.

Our artist's last period of activity in Prague already shows clearly that he is in complete sympathy with the modern art movement in Austria; but the manner in which he approaches the modern standpoint testifies to his high degree of originality and to his refined conception of art. His first productions in this manner are his Café Corso and the Hotel Central in Prague.

But it was only with his call to Vienna as director of the architectural work connected with the Hofburg, and with the commission entrusted to him in connexion with the architectural execution of the regulation of the Wien River, that Ohmann entered the field of activity to which his artistic position entitled him.

Unfortunately but few of his eminently important artistic designs for the Hofburg found their way into publicity; but what a wealth of artistic production is revealed by the various undertakings connected with the regulation of the Wien River, and more especially the decoration of the arches of the various bridges, of the superintendent's house in Hadersdorf-Weidlingau, of the refreshment kiosk in the Stadt Park, and of the villa in the Gloriettegasse in Hietzing. The latter, as a thoroughly modern building, yet harmonising so well with the town and

Design for the Revision of the Karls-Platz, Vienna.

By Professor Friedrich Ohmann.

landscape of this historical old suburb of Vienna, best shows the artistic intentions and aspirations of the artist. The pearl among the productions of the last few years is the Elizabeth Memorial in the Volksgarten. Ohmann, by including a large portion of the park in the general scheme, to form a grove near the actual memorial of the Empress, with a spring and a little lake in front of it and shady walks and plantations, has left posterity an evidence of his poetic feeling.

The new Museum Carnunti, in Deutsch-Altenburg, destined for the preservation of the Roman excavations of the district, must not be forgotten.

Ohmann has prepared an important design for the Historical Museum of the City of Vienna, and has also made in connexion with this very serviceable studies on the improvement of the whole of the Karls-Platz on which it was to be situated.

There is, besides, a whole series of very valuable sketches which belong to this time, which, as in the case of the above-mentioned buildings and designs, can only claim to form a characteristic selection from the activities of the artist. Since 1904 Ohmann has held an appointment at one of the two schools of architecture connected with the Academy of Plastic Arts in Vienna—a piece of good fortune for the rising generation of architects and for the present architectural activity generally.

With masterly skill he guides his pupils in the right direction, never forsaking the paths of good tradition, but conforming without over-emphasis of style to modern requirements, and teaching them to find ever the right expression for each piece of work in hand: the only correct artistic intention. He deserves great credit for thus developing national art in his school.

Apart from his powers as a designer, Herr Ohmann is gifted with remarkable talent as a draughtsman and illustrator: his sketches of historical buildings in Prague, Cracow, and Lemberg, usually in pen and ink or in monochrome, are masterly in their handling. The artist won special recognition in this domain by his series of plates illustrating the buildings in the baroque style in Vienna and the Crown demesnes of Austria, mostly executed in pen and ink in his well-known manner. In Ohmann's water-colour drawings, mainly illustrating his own designs, he charms by the originality of his colour schemes. As a gem amongst these water-colour drawings might be cited the complete sketch of his design for the regulation of the Wien River in the Stadt Park.

Amid the present confusion of architectural conceptions Friedrich Ohmann's artistic personality is sharply defined. In the pages of the History of Art he will surely find a recognised place.

Those who would like to study in more detail the works of Professor Ohmann will find in "Friedrich Ohmann's Entwürfe und ausgefuhrte Bauten," published by Anton Schroll & Co., Vienna, a magnificent series of reproductions from his designs and drawings. In this book, from which two of our views are taken, all Professor Ohmann's more important works are dealt with, and numerous studies and sketches from his hand are delightfully reproduced.

Parish Church, Zlonic: Reconstruction and Decoration of the Presbytery.

From *Friedrich Ohmann* (Anton Schroll & Co., Vienna).

THE LONDON SOCIETY.

The first meeting of the London Society was held on Thursday, May 23, at the Galleries of the Royal Society of British Artists, Suffolk-street, Pall Mall, under the Chairmanship of Sir Aston Webb, R.A.

The Chairman announced that, in accordance with the resolution passed at the preliminary meeting, a number of gentlemen had met and prepared rules for the Society, but these rules would, of course, be subject to such alteration as experience might show they required.

Dr. S. Miall moved and Mr. D. B. Niven seconded the adoption of the rules.

Mr. H. V. Lanchester raised the question of fixing the subscription at 1*l.* 1*s.*, and urged that, whilst he had no objection to that sum, yet it would be well to put the Society on as democratic a basis as possible so as to draw in those who were interested in London but could not afford that sum unless they got something in return, such as a club.

Mr. J. May, L.C.C., supported Mr. Lanchester, and pointed out that there were, for instance, Labour and other members of the County Council who could not afford more than 5*s.* a year subscription.

Mr. H. H. Statham suggested fixing the subscription at 10*s.* 6*d.*

After discussion, it was agreed, at the instance of the Chairman, that the matter should be further considered by the Executive Committee.

On the motion of Mr. Paul Waterhouse, the following gentlemen were elected on the Council: Sir George Alexander, Sir J. Wolfe Barry, Sir Thomas Brock, R.A., Professor Reginald Blomfield, A.R.A., Mr. W. D. Caröe, M.A., F.S.A., Mr. J. M. Dent, Sir Alfred East, R.A., Sir Douglas Fox, Mr. Thomas Gautrey, L.C.C., Mr. C. H. St. John Hornby, Sir J. Pritchard Jones, Bart.; Mr. Philip Norman, LL.D., F.S.A., Sir E. J. Poynter, Bart., P.R.A., Sir Aston Webb, R.A., C.B., Sir Frank Short, R.A., representing the Royal Academy, Mr. Leonard Stokes, representing the Royal Institute of British Architects, Sir George Frampton, R.A., representing the Royal Society of Sculptors, and Mr. C. J. Allan, representing the Mansion House Council on Health and Housing.

The Chairman said it was proposed to have two representatives of the Royal Academy, and one representative each from the Royal Institute of British Architects, the Royal Society of Sculptors, the Institution of Civil Engineers, the Surveyors' Institution, the Mansion House Council on Health and Housing, the Municipal Surveyors' Association, the Architectural Association, and the National Housing and Town Planning Council. Ten other gentlemen would be co-opted by the members of the Council.

Mr. May suggested that Sir John Benn and Mr. Cyril Jackson, of the London County Council, should be invited to join the Council; and another suggestion was to include a representative of the Institute of Builders.

The Chairman said that there would be the opportunity to elect those gentlemen amongst the co-opted members, and the matter would be considered by the Council.

The following gentlemen were elected as the Executive Committee:—Professor S. D. Adshead, Messrs. Herbert Batsford, C. C. Bradley, Arthur Crow, T. Raffles Davison, Douglas Fox, J. Hutton Freeman, Vincent Harris, A. H. Hodge, Brook Kitchin, W. L. Lucas, D. B. Niven, Professor Beresford Pite, Messrs. G. Stevenson, Carmichael Thomas, R. G. Todd, Raymond Unwin, Paul Waterhouse, Maurice Webb, W. Willett, B. W. Young, T. H. Mawson.

Dr. S. Miall was elected Treasurer, and Mr. H. J. Leaning Hon. Secretary.

The Earl of Plymouth subsequently presided over a largely-attended open meeting, when Mr. T. Raffles Davison read a paper on "London as It Is and as It Might Be."

The Chairman said that some persons might be inclined to think that the London Society had taken upon itself the task of guidance or interference with the authorities who rightly controlled the London buildings and improvements. He wished emphatically to state that was not the promoters' intention. But as they believed all good citizens should take an intelligent interest in the growth and changing development of the capital of their country, so did they wish to stimulate and to focus that interest, to give the public some guidance, and to help them to exercise that legitimate influence that they ought to exercise upon the mark which our own generation was leaving upon the planning and the stones of the metropolis. They knew how in the days gone by in the small community of Florence the citizens used to assemble together in their chief square and approve or disapprove by show of hands, or by some such simple method, the designs of the proposed buildings of their city. They could do that because their eyes had been trained to a sense of beauty from childhood, and all the inhabitants who took the trouble to examine and discuss the designs were competent to express an opinion. Of course, under present conditions such a thing was impossible, but none the less it was useful and right that there should exist an organisation from which an expression of general artistic opinion could proceed with some weight and authority behind it. One other subject they might bear in mind. The guardians of public money, be that money derived from taxes or from rates, must hesitate to recommend large public expenditure if they were not assured of public approval and support. Such a Society as theirs might help to form public opinion, and might render great service to those who would willingly take the right course and initiate some splendid improvement if they were certain of such general support voiced by such a Society.

Mr. T. Raffles Davison then read the following paper, entitled—

LONDON AS IT IS AND AS IT MIGHT BE:

The Problem of London.

"What London really is no one fully knows; what it might become no one can imagine. Greater London is already so vast as to be incomprehensible, with its seven million inhabitants, 600 square miles of area, 2,000 miles of streets, 600 railway-stations, and an annual cost of over twenty-five million pounds for government alone. Should it go on doubling every fifty years, its growth would become intolerable and impossible. To prevent it stretching north to Nottingham and west to Bristol we should be compelled to create a zone area into which it might not spread. But, whether we quarrel with the growth of our child or not, we ought at least to see that it is well dressed and clean, fair to look upon, and free to live a gracious life, not clothed in ill-fitting dress or swaddling robes for ever. In view of what it is and what it might be, the state of London now is so lamentable and so disheartening that it calls for immediate and united efforts from all who can help to make it better.

With its huge population, London tolerates the inconveniences and disabilities of narrow streets, originally planned for a town of a few thousand people, and reduces this obvious inconvenience by dint of smooth paving, rubber-wheeled carriages, motor-driven traffic, and a highly-organised system of police, whilst patiently accepting the ceaseless congestion of traffic. The magnificent waterway of the Thames, no longer occupies the same relation to the city which it once did. The city is now not a place to live in as formerly, but is mainly used for business purposes. Our city churches, which are still amongst our finest architectural assets, have now been partly relegated to a backwater off the stream of city life. Our ancient corporation has been compelled to divide its labours with the County Council. With our immense and intricate system of local government, including twenty-eight borough councils, forty district councils, and the London County Council and the City Corporation, London has almost reached the position of a small empire which requires the separation of purely local matters from those of larger moment. What wonder is it that, in this aggregation of interests, their due relation and relative value have been seriously overlooked?

There is nobody specially to blame for the present state of London. You cannot blame the Lord Mayor; he is too busy. You cannot blame the City Corporation; its age and its dignities are surely heavy enough burdens to carry? It supplies hospitality to the whole world, and pours charity in a ceaseless flood over every great sorrow and disaster. For these things alone it deserves to live. The County Council is, we are told, the first administrative body in the world, and it is an honour to serve on it, but it sits seventeen hours at a stretch, and it cannot get through its work. It deals with an important subject, like the entrance to the Mall, at six o'clock in the morning, after an all-night sitting on sewers, tramways, and schools, troubled all the time with the politics of the Progressives and the Moderates. You could not blame the County Council.

Though nobody is to blame, the indictment is against us all. The present state of affairs would surely not be tolerated in Munich or Basle, in Paris or Vienna. The city sentiment in these places would surely not permit the beauty and amenity of the city to be disregarded. The sentiment there calls for pleasant gardens, fine boulevards, noble buildings, beautiful vistas, and cheerful streets. And when this sentiment reaches London we shall get these things here. Is it sentiment we lack?

It is in no spirit of superior wisdom that we venture to point out how ill-prepared London has been for the great and marvellous development of the last fifty or seventy years, and how we have failed to foresee the advent of steam power or electricity, or the widespread revolution which these have caused in manufacture, traffic, heating and lighting, and how little we now foresee the developments which will still take place.

It would be impossible to enumerate the evils which have resulted from lack of foresight. When we look at the banks of the Seine we marvel at the muddy banks along the Thames. When we see what other cities do with navigable rivers we wonder why we lack a pleasant and speedy traffic on our fine flowing stream. When we consider our riverside park at Battersea we wonder whether Paris or Vienna would not have transformed such a possession years ago into a beautiful, instructive, and solacing delight for millions. When we consider our huddled congeries of mean streets our minds go back to Christopher Wren. When storms arise about open spaces, such as Euston-road and Edwardes-square, we know that long ago the valuable heritage of certain of London's garden squares and road frontages should have been secured for ever as a public right. Is this condition of affairs the outcome of our business methods and practical minds, or is the lack of that finer quality which is called imagination?

To many who have given little consideration to the subject a plan seems to call for great expenditure and a consequent increase in taxation. The reverse is the case. A new plan ensures that, when any public work shall be undertaken, it will fall into its proper and predetermined place in the general scheme, and thus contribute to the unity, convenience, and beauty of the whole. To anticipate and provide for a great public improvement, instead of being more costly, is less so. Surely a great and comprehensive plan scheme is needed at once if a noble future is to be secured. Immense sums of money will be spent on London as the years go by, and it will be a matter of everlasting regret if new bridges and embankments, fine new thoroughfares, and great public and commercial buildings are not erected in consonance with some settled scheme of orderly and dignified design.

London is being robbed continuously and relentlessly of golden opportunities for improvement, and the theft is often committed in the name of the very thing it takes away. The problem of London to-day is how to form a proper estimate of its future possibilities and how to provide for an authoritative and wise control which shall ensure its continual improvement and beautification.

The London Society's Aims.

To make London a perfect and beautiful city by the concentration and unification of existing forces, and to stimulate the sympathetic interest of its citizens towards this end defines in general terms the policy of the London Society.

In a thousand ways philanthropic, æsthetic, and scientific influences are continually at work for the improvement of London. No government, no council, and no society can claim a monopoly of this work. But all these beneficent efforts are too disjointed to give satisfactory results, and it is the endeavour of the London Society to co-ordinate these activities and to secure a common ground for the fair and impartial consideration of all the needs of London.

We know, of course, that the first word of beautification or artistic development freezes the blood and arrests the sympathies of many great citizens whose desire for economy, or overpowering sympathy for the poor, blinds the vision as to the necessity for a generous and catholic view of life, and for the spirit of foresight and enterprise in the development of a great city. But even for such as these the aims of the London Society need have no terrors. One of these aims is to make the consideration of art as far as possible part of every problem we have to face, to guide our industrial and commercial enterprises, our municipal improvements, our business and pleasure into such directions as shall make our environments more beautiful and our daily lives more pleasant.

It is not absolutely necessary to have a public convenience or a monumental fountain as the two equally important objects in a public square; it may not be necessary to bring coal through London to get it to Brighton; to make pickles or beer in the centre of the city; to have barracks put where they spoil a fine thoroughfare and a beautiful park; to barricade our parks with lofty railings; to make public lighting arrangements ugly instead of beautiful, or confine the expression of our public joy to red and yellow bunting.

Civic beauties satisfies a craving of human nature so deep and so compelling that people travel far to find and to enjoy it. The orderly arrangement of fine buildings and monuments brings fame and wealth to a city. You have only to wipe out in imagination Wren's churches

and Somerset House to realise how poverty-stricken London would be without the work of two architects alone. You need only compare Waterloo Bridge with the Charing Cross Railway Bridge to realise what nobility and dignity are created or destroyed in providing traffic road-ways over a river.

It would take too long to give even a summary of all that might be done and should be done to guide and control in the best future of our capital. It might be divided into various heads, such as Sanitation, Traffic, General Town Planning, Building Control, Tree Planning, Parks, Gardens and Public Amusements. Limitations of Nuisances, such as smoke, smell, noise, advertisements, and ugly sky lines. When we enumerate subjects like these we may be told at once that agencies are already at work for their consideration. This is true enough, but these agencies, many of which are official and authoritative, are not governed by one supreme controlling power, and consequently can do comparatively little. It is the aim of the London Society to secure a fair and impartial view of all these things, and a better inter-relation and sympathy between their many activities.

The London Society speaks for ideality of life, a better, pleasanter, and more artistic environment for the daily life of all, of rich and poor. It calls to its aid the services of statesmanship, philanthropy, science, economics, and art. It asks the help of politicians, engineers, social reformers, business men, and artists. The sympathetic association of every class of intelligent workers towards a great aim offers rewards of a kind that most men value. We all know that the pursuit of an ideal is in itself a good thing, even though we fail in its complete realisation. And in the London Society we shall keep clear of politics. We shall find red-hot Radicals bearing with us all in the conservation of ancient monuments, and crusted Tories -if there are any left—will work hard for the clearing away of ancient slums. The Socialist is, of course, at one with a society which aims to give beauty and joy equally to Pimlico, Whitechapel, and Belgravia.

Whatever others have done, or may do, we hold there is urgent need for the London Society. It is believed that the Council of the London Society will be competent to advise us to a right course to take in ensuring the best, economical, and artistic development of London. But its mission as an advisory body may even yield in importance to its educational influence in bringing forward for discussion and illustration all the conditions of success for the perfect development of London in its material aspect.

It is not the object of this paper to do more than suggest the many lines of development, which need forethought and the many means of ameliorating existing conditions, which need the continuous study and attention of the London Society. Whether the London Society will ever fulfil the aims which are at present in its birth it is impossible to say, but it is naturally expected that something should be stated as to how it is hoped it may realise those aims and what its course of action may be. The following will probably cover most of the fields of effect in which at first it may work.

The London Society's Work.

In the forefront of everything is the encouragement of all schemes which will tend to make London a fine city as to health, beauty, and general amenity, and to stimulate the imagination of all its citizens as to the possibilities of its future.

As a means to this several specific lines of action are suggested :—

1. To advocate the establishment of a central authority.

2. To advocate reform in the Building Acts which will compel a proper consideration as between heights and widths of streets.

3. To obtain some better guiding rule as to building line and to watch their development so that better architectural and economic results may be obtained.

4. To guard the amenities of our noble river and to save it from degradation. There seems grave risk at this moment that its fine northern embankment may be ruined by a seven-story hotel built about 100 yds. in advance of the general line of frontage. To secure the consideration of the artistic point of view in all works of Borough or County Councils by means of advisory committees.

5. To work for a better and more adequately distributed park system, with a view to provision for future extension ; and also to do all that is possible for the increase and extension of open spaces.

6. To secure the better opening up of good public buildings.

7. To insist on the completion of improvements and to impose measures which prevent it.

8. To do all that is possible towards the co-ordination of all schemes and plans which will gradually lead to the best general plan scheme for the whole city.

9. To endeavour to bring into a better method of order and decency and design all the various objects which are placed in the streets and open places, such as street lights, conveniences, shelters, kiosks, statues, etc. This might be defined as a sort of tidying-up process.

We have a County Council whose prodigious activities, if generally known, would amaze the public with the scope and extent of its administrative and protective services, a unique City Corporation with control of enormous funds. We have twenty-eight Borough Councils, each of which does more work than those of half our country towns, and we have forty District Councils. Over all these we have a vast Water Board, an Asylums Board, a Port of London Authority, and innumerable private associations for the accumulation of human activities, such as the Smoke Abatement Society, the Society for the Preservation of Ancient Monuments, the Metropolitan Gardens Association, the London Playing Fields Society, the Scapa Society, the Mansion House Council on Health and Housing, the Co-partnership Housing Council, the Garden Cities and Town Planning Association, the Royal Institute of British Architects, with its Town Planning Committee. We have also Public Health Acts, with their sanitary by-laws, our Building Acts, our magnificent police system for controlling traffic, Annual Improvements Acts, Advertisement Regulation Acts, Housing and Town Planning Acts, etc.

The Anomalies of London.

But in spite of all these, anomalies, such as never could exist except in this country, may be named as follows: —

1. Local bodies with a right to veto any general scheme for London, which, however good as a whole, may be thought to damage small local interests.

2. The main body so absorbed in its manifold duties of the present that it has no time to stop and consider the future, with the result that, until two years ago (with the exception of two imperative schemes such as Kingsway and Millbank), very little heed has been given to the future needs of London or to the lines upon which it should develop.

3. Such improvements as are made are done for strictly utilitarian reasons in a strictly utilitarian way after great pressure.

4. Improvements which, by not being sufficiently comprehensive to include properties affected, as well as those contiguous to a new street, leave unletable patches and ugly fringes of old buildings which remain for sometimes fifty years as left.

5. Railways, not only originally allowed to devastate large tracts of central areas with their viaducts and yards and stations, but also to neglect them deplorably and increase their original ugliness.

6. Huge areas of slum property which cannot be dealt with publicly owing to exemption of such areas from the Town Planning Acts and the failure of the Housing Acts, nor privately owing to the obstinacy of fossilised owners who refuse to co-operate with those adjoining who may be willing to rebuild.

7. Untold waste of fine sites through bad access, etc., owing to want of co-operation between owners and authorities, resulting in the perpetuation of such districts as Soho and Covent Garden hard by the most important and wealthy streets in London.

8. Great public buildings, such as the Central Criminal Court, the British Museum, the Institute of Chartered Accountants, the Wesleyan Hall, and the Westminster Cathedral, hidden away in narrow streets and lost to public view.

9. The smoke question lost or only half administered in a tangle of vested manufacturing interests.

10. Advertisements scattered wildly everywhere without reference to the interests of adjoining or opposite owners or public, because the Act regulating them is optional and not compulsory.

11. Narrow and unhealthy streets made even more unhealthy by the power given to owners to erect high buildings in them regardless of the width.

12. Perpetuation of bad alignments and projection in streets because owners have power to do so, and it is no one's business to suggest public action to prevent it.

13. Buildings erected of the most fantastic design, most incongruous with their surroundings, and of materials of most vivid colours and unsuitable texture.

14. Costly new buildings rising where manifestly improvements will rapidly necessitate removal.

15. Parks in excess of requirement in some places and entirely absent in others.

16. Both parks and squares closely barricading and obscuring the view, obstructing passage and destroying all sense of freedom and space.

17. Streets obstructed by permanent erections above and below ground, such as conveniences, kiosks, orderly-boxes, cab-shelters, ambulance-sheds and refuges, usually in the worst possible taste.

18. Tree planting on a miniature scale, and even then without reference to surroundings.

19. The invasion of residential districts by manufacturing and commercial buildings, and *vice versâ*, and an entire absence of any attempt at civic, administrative, or educational concentration.

20. And lastly, a chaotic system of goods collection and delivery whereby enormous waste is caused, both in time and the space occupied for goods yards."

Mr. Davison then showed on the screen a number of illustrations bearing on various aspects of the subject. Among the more important of these were a series illustrating London as it is, lent by Mr. Crow, many of these being devoted to showing the crowded condition of the East End, and how this is becoming accentuated by the building over of back gardens and houses of increased height in narrow streets.

These slides were followed by a series showing the deplorable architectural muddles surrounding most of our principal railway terminal stations.

The detrimental effect of Blackfriars railway bridge was next illustrated, and then a number of ill-considered new alignments in street frontages either in connexion with improvements or simply due to the neglect to take advantage of opportunities.

The ineffective termination of Rosebery-avenue was next shown, and following this the appalling jumble now facing the east end of Holborn Viaduct. "Bart's" chimney on the left, the dull blocks of the new General Post Office in the centre, and the razor edge of the Newgate-street corner on the right.

Following this were slides showing the unfortunate sky-line of the Piccadilly Hotel rising above the sweeping lines of Regent's Quadrant, the encroachments in the Euston-road over forecourts which were nominally protected by an Act of Parliament, the miserable termination of Northumberland-avenue, and the damage done to the effect of Parliament-square by the frontage alignment of the new Middlesex Guildhall.

The audience was then asked to consider the question of congested traffic, and slides were shown illustrating the effect of defects in street planning in Commercial-road, High Holborn, and other points. Then a series of new buildings unsuited to their surroundings was given, succeeded by a number of plans for the improvement of London, among which we may mention the following :—

Evelyn's and Wren's plans for rebuilding after the Great Fire.

Professor Adshead's plans for the rearrangement of the Marble Arch, the opening up of the British Museum, and the improvement of Hyde Park-corner.

A series entitled "John Burns's London" and "Imperial London," showing the removal of the railways to the south side of the Thames and the further developments such a proceeding would render feasible. These designs, which were shown by permission of the *Builder* (see issues of January 6, 1911, and January 5, 1912), embody Mr. Paul Waterhouse's suggested southern road from the City to Westminster, and other schemes that have been brought forward from time to time for the improvement of London.

The next slides exhibited Mr. Lucas's and

Mr. Collcutt's schemes of a Charing Cross-road bridge, as well as one illustrated in the *Sphere* in connexion with the King Edward Memorial. We then pass to Piccadilly-circus and see Mr. Norman Shaw's and Mr. John Murray's plans.

Then Outer London and main traffic routes came under review, with Mr. Crow's radial roads leading to "cities of health." Mr. Niven's zone line, a ¼-mile wide, and Mr. Paul Waterhouse's improvement on the Traffic Commission's lines of route.

Mr. H. V. Lanchester's suggestion for duplicated streets, each taking traffic in one direction only, was then dealt with in an illustration taken from Bond-street with Albemarle-street continued parallel to it.

Various possibilities in street alignment and in the arrangement of parks and gardens were illustrated by plans and views from various Continental cities, and finally two schemes for the arrangement of the proposed London University, the work of Mr. D. B. Niven and Mr. H. J. Leaning respectively, were shown on the screen.

It was regrettable that the number of the slides prevented an adequate explanation of each in the time at the disposal of the lecturer; in order that they could be properly understood at least an hour would need to be devoted to these alone, and it should have been recognised that it was out of the question to attempt to cover so much ground in so short a time as that available.

Continuing his remarks, Mr. Davison pointed out that:—

"Foremost amongst the immediate possibilities for London is the improvement which might be effected under the direction of a parks or garden authority. Why are our parks and gardens railed off from the approach of the public with lofty railings as though we were kangaroos or elephants? One thing which strikes an Englishman so much in foreign cities, like Munich, Düsseldorf, Vienna, and Berlin, is that the public are allowed to get much more enjoyment out of the parks and open spaces than we are. If our railings were half the height they would cost less to maintain and lay our parks and gardens much more open for our pleasure. But why could not a fringe of the parks along Piccadilly and past the Marble Arch be thrown open to the roadway with paths, grass plots, flowers, and seats? Is it not possible to redeem all our garden squares from private use to ownership for the public good, without destroying the general amenity of the square, nay, even enhancing it?

The treatment of the Marble Arch is the most striking illustration, perhaps, which could be brought of our present incapacities and futilities. The agitation for its improvement was largely due to the credit of a private citizen, and it was brought at last to its present state by a combination of forces enough to cause despair in the stoutest heart. Its appearance now is worse than ever, and calls for remedial measures, if it is ever to be what its splendid possibilities suggest.

In all the agitation for the opening up of Southwark Cathedral has anything been said about the approaches of London Bridge, which call for a fine and comprehensive plan that might be given great dignity or even grandeur of effect? The removal of Charing Cross and Cannon-street railway-stations does not seem to be a project too great for an imperial city. One could almost imagine it would pay for itself, but its effect would be so fine and far-reaching that it would seem worth a great deal to accomplish.

Of course, many great public buildings have their location already fixed. But the question of sites for important new buildings leaves much to be done, so that such sites may be carefully considered as to their surroundings. It is one of the worst regrets in the history of Modern London that we might have now gradually built up one of the finest and most impressive groups of public buildings in the world had there been any general scheme for the laying-out of sites for the Natural History Museum, College of Science, Albert Hall, College of Music, and Victoria and Albert Museum, which are now planned one behind the other. Surely a well-planned square mile of public buildings might have been one of the finest city effects in the whole world!

Here we are to-day faced with proposals for a hundred miles of new streets, with town-planning schemes in every quarter of London, with projects for new buildings of great magnitude, consisting of Colonial Government Offices, an Imperial University, a central Settlement House, offices for the Water Board, a home for the London Museums and the National Theatre, much-needed extensions of our National Picture and Sculpture Gallery, a national exhibition building, homes for learned societies, insurance companies, hotels, even larger than we have now, an inevitable increase in the huge blocks of central-heated, central-kitchen residential suites. Who is there to exercise any watchful care that such opportunities shall not be wasted, and that mistakes such as have been made in the past shall not occur again; and, above all, that due regard shall be given to the artistic element, without which all our efforts may leave us in a worse plight than before? At present no one! Only the individual whose separate and isolated needs cannot be satisfied without some general co-operation between themselves and the landowners and authorities. That is where we hope that a disinterested body like the London Society may help in a way that no government department nor improvement committee could possibly do.

On all hands we are confronted with pleasing visions of possible improvements. It is not the mission of this Society to form a sort of clearing-house for all the ideal dreams of enthusiasts, but it would ill fulfil its mission unless it offered all the help it could to the encouragement of ideality.

Nearly every important city centre and great thoroughfare presents opportunities for improvement. Many of these could be effected with little cost, others could be carried out gradually, and as parts of larger schemes which would in the end probably pay for themselves. Such things as the following occur to us at once (of course, in a superficial way). In St. George's-square you may well imagine that the main traffic might well pass through the central garden, leaving island gardens to the east and west, and thus giving greater privacy and quietude to the surrounding buildings. In Lincoln's Inn-fields one wonders why diagonal paths across the garden ground are not practicable. The idealist might think that Regent-street should have had an upper pathway at the first-floor level, like the old Chester Rows, and thus provide two rows of shops in place of one. The Mall roadway might surely be as pleasant as the Unter den Linden in Berlin, and the public allowed to sit under the shade of trees and rest. We wonder if there is ever to be a great southern embankment to the Thames, or if it is always to remain an alternating stretch of cathedrals, wharves, railway-stations, County Hall, and hospital without unity and beauty of effect. May we have flowers on our lamp-posts, less dangerous crossings of streets, covered footways to our bridges, and scores of other things which are possible to a city which is an Empire in itself?

They must indeed be destitute of imagination who cannot be affected by the thought of what is possible to beautify, to dignify, and to transform London so that it should become a magnificent and perfectly-governed city; and it must be remembered that without imagination we can do nothing. No one ever had in the past so fine an imagination as to realise what London now is. A great waterway might, of course, be lined on either side by fine embankment roads bordered with trees, gardens, and great buildings, with vistas leading through to the main thoroughfare beyond. A great roadway might lead from the west front of St. Paul's in a direct line to the Law Courts. A fine north and south avenue would lead over the river to the south transept of St. Paul's, giving off traffic east and west, and a wide roadway to the north of the Cathedral would connect traffic from Holborn by a new east-end road direct to Broad-street Station. The railway-stations could be shifted to the south side of the river and their bridges disappear. Battersea Park might be transformed into a great national pleasure-garden. Our streets would gradually be tidied up and made decent by the disappearance of ugly erections as prominent features in the view. We should cross great centres of traffic easily and pleasantly by underground ways or road bridges. Trees and outdoor *cafés* would enliven our streets in summer-time. River traffic would be developed, and we might again have water pageants come to life. The bridges would have covered footways. Steam railways, horse traffic, and tramways would be banished to an outer zone; sky signs, hideous advertisements, smoke nuisances, and the manufacturing smells would disappear. The air would be clear, the buildings more cheerful, the avenues and vistas finer, the squares and streets pleasanter, the traffic easier—in short, London would be practically improved and beautified.

From time to time we receive stern reminders as to the real essentials of human hopes and work. For the moment we now perhaps take less pride in the marvel of a 50,000-ton steamship than in the human sentiment and heroism which accompanied its final doom.

Slippery dividends and luxurious life sink for a time, and sentiment floats upon the waters.

Whilst we muddled through the Boer War we should have found our millions of money of poor avail without the national sentiment and sacrifice which it evoked. London's wonderful development has given little rise to fine sentiment, and apparently evokes little great art. If we are busy now trying to undo past mistakes, there are some we shall never cast behind us. Whilst Paris, with all its wars and social troubles, has gone on steadily developing into a fine and noble city because the plans were well laid beforehand, we have muddled away at partial, ill-completed efforts.

We have two banks to our river, but only one embankment, and no one completely impressive thoroughfare. Many fine buildings but half-buried and out of sight, splendid chances like Waterloo-place and Trafalgar-square, but nothing finally grand and noble.

Is this the outcome of a business turn of mind? Is it a lack of that fine civic sentiment which seems so much in evidence in other lands? The development of a city like ours depends on business methods and practical design to bring it to completion, but this Society believes there needs a stimulus behind this which must come from the heart and the imagination. May not the apparent despair of Modern London show us there is something higher than the everyday facts of economy and politics?

As a mere business venture you would be ashamed to run London as it is now—a mass of complicated and conflicting organisations, a surging sea of struggling forces, pulling in all directions without firm, conclusive, and statesmanlike control. It is not economically sound as a matter of business. It is not decently attractive as a world-show. We are a wealthy city, and have spent twelve millions in sixteen years on public improvements. But Paris spent fifty-three millions on the city, and has earmarked thirty millions more. In 1907 tourists and travellers alone spent 120 millions in France in hotels, travelling, shops, etc. What is fifty millions to that? What proportion does our outlay bear to our vast size and great income?

As a great and noble embodiment of city life, as the capital city of a vast Empire, we cannot stand comparison with many small cities of the world. A needful sentiment is lacking. Can it be aroused? A distinguished writer said the other day: "Everything noble, beautiful, and splendid that has ever been written, sung, painted, or done since the world began has been born in sentiment, carried through by sentiment, and remembered by sentiment." Shall that sentiment which ennobles, idealises, and inspires be lacking for the great and immediate necessities in the improvement and beautification of London?"

Mr. Forbes Robertson said he was a Londoner bred and born. He always had thought poor old London hideous, but that night it had been borne in upon him that it was more hideous than he thought. It was true, as the lecturer had said, that they depended on the feelings of the people and the sentiment of the people to get better effects out of London, and it could be got. London had great charm and individuality, but a city or a State got just as good art as the people of that city or State wanted. If as Londoners they wanted beautiful statues and elevations and streets they would have them eventually, and certainly no city in the world gave greater opportunity than London. He admitted that they had improved, and that there had been considerable improvements, but they had not made the advance in beautifying London that they should have done. Painting, architecture, music, and the other arts had improved and developed, and they had also seen proposals brought forward for changes in London, some of which he sincerely hoped would be carried out. There were, however, certain small matters which, to their disgrace, were not carried out and which the expenditure of a few thousands of pounds would remedy. In Trafalgar-square there was a perfect monstrosity perpetrated. They remembered

the statue of Charles I., which was a poor affair, it was true. [Mr. Granville Smith: No; it is one of the finest in London.] He ventured to say that the statue of Charles I. was a poor affair, but that the pedestal was one of the finest in the world. Even against this statue, commemorating as it did the sorrows of a remarkable king, who at all events had a great artistic sense and feeling, within the last ten years had been placed a monstrous iron lamp and a lavatory. There was no necessity for such a thing as that, and it was only one of many cases of the same kind. That Society must try and impress the minds of the men and women who, when they looked at a picture or an elevation or statue, said: "I do not know much about it, but I know what I like." They wanted enthusiasm, and if only those present would go away with the determination to look into these things much would be done. He had just come from an extended tour in the United States, and had visited sixty-four cities, and he had found the energy and enthusiasm of the citizens had produced some statues and buildings in most of these cities which were remarkable and extraordinary. He had paid a visit to Sicily and delighted his soul with the remains of the Greeks on that beautiful island. Coming back *viâ* Rome, he was talking with a distinguished prelate, who asked him if he had been to Athens, and told him he regretted he had not. This gentleman said: "It may seem curious to you, but I can assure you that you who know Sicily so well have a better idea of the ancient civilisation of the Greeks than if you had only gone to Athens." Now history was repeating itself. Were they to let future generations discover that the Mother Country was being outdone by the great cities of America and Canada? In London he was afraid they were too parochial, and the man who had the money to provide for beautiful buildings and other things wished always to interfere. He asked such people to take a lesson from the citizens of Chicago, who for their Exhibition called in the finest men of the State and asked for the best, and these men produced their White City, which was like some fantastic dream, so perfectly designed and proportioned was it.

Capt. Jessell, M.P.,

said he agreed with the objects of the Society, but with regard to health they had to remember that London was one of the healthiest cities in the world. An indictment had been made against the municipal authorities, but one of the greatest sinners was the Office of Works. He suggested that it was time they had a Minister of Fine Arts in this country, who would be responsible for things other than making the Crown properties pay.

A vote of thanks to the Chairman and to Mr. Raffles Davison concluded the proceedings.

ARCHITECTURAL SOCIETIES.

Manchester Society of Architects.

At a meeting of this Society on the 24th ult. the report and accounts were approved and adopted, and the following officers and members of Council were elected:—President, Mr. John Brooke, F.R.I.B.A.; Vice-Presidents, Professor S. H. Capper, M.A., A.R.I.B.A., and Mr. F. B. Dunkerley, F.R.I.B.A.; Hon. Secretary, Mr. Isaac Taylor, F.R.I.B.A.; Assistant Hon. Secretary, Mr. J. T. Halliday, A.R.I.B.A.; Members of Council, Messrs. A. E. Corbett, John Ely, W. C. Hardisty, Joseph Holt, P. D. Lodge, Paul Ogden, Claude Paterson, J. H. Sellers, G. Sanville, Edgar Wood, J. H. Woodhouse, and P. S. Worthington.

From the forty-eighth annual report we take the following:—

"The Council have long felt the advisability of getting more closely into touch with the outlying and distant parts of the Society's extensive province. To do this they have now decided to divide up the whole area into twenty-seven districts and to appoint in each an architect to act as correspondent for his district. By this means it is hoped to obtain the very earliest information of any proposed competitions and town-planning schemes, and generally to extend the usefulness and influence of the Society.

During the past year the attention of your Council has been drawn to two cases of tradesmen openly offering, by letter, a commission to architects. In each case the correspondence was submitted to the Royal Institute of British Architects with a request that the tradesmen be prosecuted under the Prevention of Corruption Act, 1906. In one case the Royal Institute expressed satisfaction with the explanations given by the tradesman, and in the other case the architect who laid the matter before your Council declined to be associated in the legal proceedings which the Council of the Royal Institute instructed its solicitors to take, and, as without his assistance legal proceedings could not be taken, your Council had reluctantly to consent to the proceedings being dropped.

The members will remember that last year the Council interested itself in the preservation of the Old Town Hall in King-street, and addressed to the Manchester Corporation and to Lloyd's Bank a resolution urging the careful consideration of the possibility of saving this building. The President, on behalf of your Council, addressed on February 15, 1912, the following letter to the press:—'Sir,—My Council understand that the Parks Committee have under consideration the removal and re-erection of the scholarly and dignified façade of the Old Town Hall in King-street to a suitable position in one of the Manchester parks. The Council of the Manchester Architects are strongly desirous of giving all the support that they are able to such a proceeding, and in this they are strongly supported by their professional brethren throughout the kingdom. It would by for ever an interesting monument of the cite history, showing a high standard of architecture attained at that time, of which any city might be justly proud. To the continuous stream of architectural students of the School of Architecture, which is a part of the Corporation scheme of education in conjunction with the University, this would have a real practical value for detail study and measurement. If the façade was re-erected with surroundings carefully selected, combining foliage and water treatment, it would always be a source of educational value and æsthetic pleasure to the public, and would support the work and intention of the Art Gallery and School of Art. We cannot urge too strongly that this is a rare example of the highest standard to which architecture has attained, and the Manchester Society welcomes the opportunity to offer such help for its partial retainment as lies in their power.—Yours, etc., on behalf of the Council of the Manchester Society of Architects, EDGAR WOOD, President.'

The Parks Committee decided that if the public showed such an interest in the proposal as to subscribe part of the cost of re-erection, then the Corporation would carry out the re-erection in one of the city parks. A fund was then raised to which this Society contributed 25*l.* (about 20*l.* of this amount has been subscribed by individual members). Your Council is pleased to report that the Parks Committee is satisfied with the response of the public and has agreed to re-erect the façade in Platt Fields.

The appeal made to the members for funds to aid the endowment of the Chair of Architecture resulted in a further contribution of 250*l.* This amount has been handed over to and has been cordially acknowledged by the University authorities. The amount of the previous contribution was 200*l.*"

OLD VIEWS OF ROME.

WHATEVER appertains to the history of the buildings of Rome has an unfailing interest for the architect. The spell that the glamour of the Eternal City has thrown over the imagination of the artists of all times and of all countries is illustrated in *Römische Veduten*, which we have received from Messrs. Friedr. Wolfrum & Co., of Vienna and Leipzig. This consists of reproductions of a series of views of Rome executed by artists of different nationalities from the XVth to the XVIIIth century, compiled by Dr. Herman Egger from the originals in the galleries of the principal cities of Europe. To the

The Crowning of Sixtus V. (1585).
A Fresco in the Vatican Library.
(From *Römische Veduten.*)

connoisseur these drawings, apart from their subject matter, make their own appeal. To the architect and the archæologist probably the chief value of such works would consist in their accuracy as contemporary records, preserving the original design of buildings since destroyed, or as throwing light upon the history of their structure and subsequent alteration, and upon the general lay-out and topography of the city; although to the architect, also, there is value in impressions, and a truth which is not necessarily a precise statement of literal facts. This collection, as a whole, makes no claim to historical exactitude, as, although some of the drawings, such as those by Maarten van Heemskerck, may probably be relied upon, some are merely fancy sketches by artists who may never have been in Rome; while considerable licence as to position and surroundings has been taken with others, which were presumably done on the spot or worked up afterwards from original sketches. All the same, the cautious student will find much that is of value, and that he has not been left altogether without guidance from Dr. Egger. The volume of letterpress, containing numerous small illustrations, which accompanies the drawings, discusses each view, and gives information as to its origin and probable trustworthiness as a record. Apart from its appeal to every man of taste, the special appeal of this publication will probably be to the student of the antiquities of Rome. To such a one a collection of drawings by such artists as Israel Silvestre (1640), Giorgio Vasari (1511-1574), Jan Asselyn (1610-1652), Schellinks, Beerstraaten, De Moncheron, and others, brought together for comparison and reference from such cities as Vienna, Paris, Dresden, Berlin, Rome, London, and Florence, will certainly be of great interest and value.

ARCHÆOLOGICAL SOCIETIES.

Exeter Diocesan Architectural and Archæological Society:

"At Home" at Rougemont House.

This Society — the oldest archæological society in the Kingdom—made a new departure on Tuesday last week by holding an "At Home" in the house attached to the historic grounds of Rougemont, by kind permission of the Mayor of Exeter (Dr. Vlieland).

The Society for the past seventy years has been in the habit of holding its meetings at the College Hall of the Vicar's Choral, in South-street, varied by visits to interesting buildings of archæological interest, and by making excursions at a distance.

The *transactions* of the Society, now entering on its third series, form a splendid monument of the work done by the Society in the past, and their records practically cover all that is to be said concerning things architectural and archæological over the whole country.

For years it included among its members the most noted and literary men of Devon and Cornwall, and such well-known names as Acland, St. Aubyn, Buller, Carew, Champernowne, Clinton, Coleridge, Courtenay, Ebrington, Fortescue, Kekewich, Lopes, Northcote, Palk, Rolle, Woolcombe—all stood upon its roll of membership, many contributing papers of great value.

With such prestige the learned assistance was secured of such names as George Edmund Street, Edmund Sedding—names which still carry weight and authority.

The Society has invariably had the Lord Bishop of the Diocese as its patron, and a distinguished layman has always occupied the office of President.

With a view to bringing the Society and its work to the notice of those interested in matters archæological and architectural, the Committee recently decided to arrange an "At Home" under the auspices of the President and officers.

The former house of the Member for Exeter, Mr. Richard Somers Gard, was, for the while, turned into a small temporary archæological museum, the members and their friends having brought sketches, prints, and diagrams, which had been suspended on the walls of the dining-room, whilst in the library was displayed a selection of the library belonging to the Society. Many of these were of great interest and valuable.

The unique collection sent by Mr. F. R. Rowley, F.R.M.S., the able curator of the museum, evoked great interest, especially the collection of seals of the suppressed abbeys, the Bishops of Exeter, the Dean and Chapter and civic seals—a valuable paper on which latter has been prepared by the Town Clerk. The seal which had most share of attention was the vesica-shaped silver seal of the last Abbot of St. James's Priory, which housed a community of the Cluniac Order, and whose extensive buildings occupied the site near the river, in Topsham-road, and known as Old Abbey.

It appears that the seal—a beautiful specimen of the heraldic engraver's art—was only known by the wax impressions on ancient documents, and it has now come into the possession of the city through the kindness of Lord Waleran. It has had many vicissitudes, and the city is fortunate in finding it a resting-place as an honoured treasure.

Other exhibits were a bronze standard city gallon, *temp.*, Elizabeth, a 14-lb. bronze standard weight, time of Henry VII., and a curious iron treasure-chest, with locks innumerable.

Two cases of so-called Samian red ware, with bronze and glass remains, of the time of the Roman occupation in Exeter, were also exhibited, a bronze Roman standard being amongst the more interesting, as belonging to a Roman legion, and found embedded in the river at Sidmouth.

GENERAL NEWS.

Professional Announcement.

Mr. James B. Dunn, F.R.I.B.A., architect, owing to the acquisition of his present chambers, at No. 45, Hanover-street, by the Government, has removed his office to No. 14, Frederick-street, Edinburgh.

Mr. H. V. Lanchester.

Mr. H. V. Lanchester, F.R.I.B.A., prior to his departure for India to join the Delhi Commission, was received in audience by his Majesty the King on Monday, the 27th inst.

Manchester School of Architecture.

The Education Committee and the University jointly invite applications for the Professorship of Architecture, the salary being 600*l.* per annum. Particulars and forms of application may be obtained from the Registrar, the University, Manchester, on receipt of a stamped addressed foolscap envelope. The last day for the receipt of applications is Tuesday, June 18.

Hotel Cecil, Strand.

Under the directions and superintendence of Mr. E. Keynes Purchase, two Palm Courts have been constructed in the courtyard and part of the approach from the Strand, and several other structural alterations have been effected, at a cost of some 50,000*l.* The site of the lounge is thus taken for the two courts, which are connected by wide steps; the upper one is 110 ft. long by 28 ft. to 34 ft. wide, and 28 ft. high; and the lower one is 93 ft. by 45 ft. and 32 ft. high; the lower court is 4 ft. below the level of the upper court, and between the east block and the lower court is a covered way, 10 ft. wide, giving access into the hotel. All the decoration has been carried out in the Louis XIVth manner in a colour scheme of blue and gold.

Rodin's "Burghers of Calais."

At the annual meeting of the National Art-Collections Fund, held at Burlington House on May 22, an interesting fact was made known with regard to Rodin's "Burghers of Calais," which will be placed on a site on the Millbank extension between the Tate Gallery and the Houses of Parliament. This work is not, as is sometimes supposed, a copy of the group at Calais, but an original specimen of Rodin's work, actually finished by the great sculptor himself. It is probable that Monsieur Rodin will himself visit England and assist in the selection of the site.

Post Office Buildings.

The Treasury have appointed a Departmental Committee to inquire into the system of providing Post Office buildings with particular reference to the alternative policies of renting or building whether by the Office of Works or the Post Office. The Committee is constituted as follows:—Sir F. Cawley, Bart., M.P. (Chairman), Mr. W. E. Horne, M.P., Mr. H. H Hambling, Mr. J. Slater, F.R.I.B.A., Mr. Howell Thomas, F.S.I. The Secretary is Mr. L. C. Bromley, of the Treasury. Mr. W. E. Horne, M.P., is the President of the Surveyors' Institution. Mr. John Slater, F.R.I.B.A., is Surveyor to the Berners estate in Marylebone. He was President of the Architectural Association in 1887, and Vice-President of the Royal Institute of British Architects from 1900 to 1904. He is also a member of the Tribunal of Appeal under the London Building Acts. Mr. C. J. Howell Thomas, F.S.I., is one of the principal valuers in the Inland Revenue Department at Somerset House.

An Architectural Tour in France.

The Rev. Dr. West, A.R.I.B.A., pupil of E. M. Barry, R.A., and of Viollet-le-Duc, and author of "Gothic Architecture in England and France," proposes to conduct an architectural tour in France during the ensuing summer. The number of the party will not exceed fifteen (ladies or gentlemen). Rouen or Paris will be the starting-point. Every facility will be given for sketching and photographing. Particulars may be obtained from the Rev. G. H. West, D.D., Selsley Vicarage, near Stroud, Glos.

London Society's Blind School, St. John's Wood.

Mr. R. C. Edwards, F.R.I.B.A., has been appointed as the architect for the additions upon the Eton-avenue side, which will be made to the London Society's Blind School, near the Swiss Cottage. The School was founded in 1838, and the present buildings, at the corner of Upper Avenue-road and Eton-avenue, were erected after the plans and designs of Mr. Kendall.

Subways in New York.

The Board of Estimate resolved at their meeting, on May 24, to conclude negotiations with the Interborough and Brooklyn Rapid Transit Companies for the construction of new subways at an outlay of about 24,800,000*l.*, on the part of the City, and about twice that amount on the part of the two companies, who share in the dual subway system. The contracts for the making and working of the subways will be referred to the Public Service Commission.

A New Firm of Publishers.

We are informed that Mr. Herbert Jenkins, who for more than ten years was manager for Mr. John Lane, has joined the publisher's ranks. He is the author of the "Life of George Borrow," which Mr. Murray published in the spring, and is also known as a Blake enthusiast, for he discovered the State papers relating to the poet's trial for high treason, and located his grave in Bunhill Fields Cemetery, which is likely to result in a memorial being erected to Blake's genius. Associated with the new venture are Sir George H. Chubb, Bt. (Chairman), and Mr. Alex. W. Hill, M.A. The new firm is to be know as Herbert Jenkins, Ltd., and the premises are 12, Arundel-place, Haymarket.

Church Building Society.

The Incorporated Church Building Society held its usual monthly meeting on the 23rd inst., at the Society's House, 7, Dean's-yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.—Building new churches at Clacton-on-Sea, St. James, Essex, 200*l.* for the first portion; Lambeth, St. Anselm, Surrey, 150*l.*; and Pontypool, St. John-the-Divine, Mon, 100*l.* for the first portion; and towards reseating and repairing the churches at Cadney, All Saints, Line., 50*l.*; and Woolwich, St. John, Kent, 50*l.* A grant of 50*l.* was also made from the special Mission Buildings Fund towards building a Mission Church at East Wickham, St. Michael, Kent. The following grants were also paid for works completed:—Elland, All Saints, Yorks, 200*l.*; Chessington, St. Mary-the-Virgin, Surrey, 15*l.*; Cricklewood, St. Peter, Middlesex, 60*l.*; Dawdon, St. Hilda and St. Helen, Seaham Harbour, 18*l.*; Penrieth, St. Christiolus, Pembs, 25*l.*; Hucclecote, St. Philip and St. James, Gloucester, 30*l.*; and East Thorpe, St. Mary, Essex, 10*l.* balance of a grant of 50*l.* In addition to this the sum of 1,070*l.* was paid towards the repairs of twelve churches from trust funds held by the Society.

Property Sales.

The properties recently placed in the market include Oaks Park, near Epsom, of which the house was originally built by the Hunters' Club for their resort in the hunting season. It passed in turn from Sir Thomas Gosling to General Burgoyne, and to Edward, twelfth Earl of Derby, who made large additions to the house and stables. The estate has finely-timbered grounds, with plantations, and gives a name to one of our "classic races."—Mertoun, 6,550 acres near Abbotsford and Melrose, formerly belonged to the Haliburtons, who, in 1680, sold it to Sir William Scott of Harden, ancestor of Sir Walter Scott; the house, built in 1702, was enlarged by the late Lord Polwarth; the rental value amounts to nearly 9,300*l.* per annum, and in the confines are the Border keeps of Littledean and Smailholm, the Sandy-Knowe familiar to readers of Scott's autobiography and poetry.—Brasted Place, Sevenoaks, with 650 acres, was built for George III.'s physician, Dr. Turton, in 1780, from designs ascribed to Robert Adam—a wing was added forty years ago; the house was occupied for a while by Prince Louis Bonaparte, afterwards Emperor of the French.—The Duc d'Orléans has just sold to Sir Charles Swinfen Eady, Judge of the Chancery Division, his estates of Bishampton and Wood Norton, near Evesham. The latter was bought of Mr. E. Holland, M.P., by the Duc d'Aumale, who added largely to the property that passed to his grand-nephew, Louis Duc d'Orléans, who rebuilt the house, in 1897, on an eminence overlooking the valley of the Avon; the wrought-iron gates at the main entrance into the grounds were brought from York House, Twickenham, and formerly stood at Versailles.—The Derbyshire County Council have resolved to purchase Mr. E. T. Hooley's estate of Risley with the object of establishing thereon a farm colony upon co-operative principles.—No. 112, Strand, erected from E. M. Barry's designs for the Art Union of London, on the Duchy of Lancaster estate, will be offered for sale on June 14.

BOOKS.

The Mechanics of Building Construction. By HENRY ADAMS, M.Inst.C.E., M.I.Mech.E., F.S.I., F.R.San.I., etc. With 590 diagrams. (London: Longmans, Green, & Co. 1912. Pp. 240. 6s. net.)

A FEATURE quite evident after a merely superficial examination of this work is the carefully-arranged logical sequence of the various branches of the general subject. The author, who has given a good deal of attention to the principles of building construction, has placed before his readers a most helpful exposition, whose practical interest is maintained chapter by chapter to the very end.

We use the word "chapter," despite the fact that the volume is divided into sections termed "Lectures," for the reasons that the subject matter is based upon a course of lectures delivered to science teachers at South Kensington in 1906 and 1907, and that the sections may be used as the basis of lectures to students. In their present form the lectures have been expanded so as to cover the requirements of students as well as of teachers, and they cover the whole ground to be traversed before the student begins to make a special study of any particular branch of constructive work.

The wide range of subjects included, and the manner in which they are treated, make the book useful as a work of reference for architects and engineers.

Numerous worked examples and graphical diagrams are given throughout the treatise, which is a welcome addition to the literature of building construction.

Elementary Principles of Reinforced Concrete Construction. By EWART S. ANDREWS, B.Sc.(Eng.). (London: Scott, Greenwood, & Son. 1912. Pp. 195. 3s. net.)

THE special merits of this text-book are that it embodies in compact and inexpensive form a simple and lucid exposition of the principles of reinforced concrete construction, with examples illustrating the design of beams and columns.

The notation adopted is that proposed by the Concrete Institute, which, it is hoped, will lead to a universal standard notation, and so obviate the trouble now experienced by all who have occasion to consult works on reinforced concrete.

Several diagrams given as examples of labour-saving devices for beam design may be commended to the notice of students, as also may be the alternative treatment given throughout for the stresses in beams and the application of the same method to the calculation of deflection.

A useful chapter near the end of the book describes some leading systems of design and patented types of reinforcement.

The volume is one we have pleasure in recommending a handy and reliable guide to the special branch of construction discussed by the author.

The Principles of Structural Mechanics. By PERCY J. WALDRAM. (London: B. T. Batsford. Pp. 369. 7s. 6d. net.)

IN view of the large number of text-books already available on structural mechanics, it may not be quite clear why another book should be published on a subject which has been so amply discussed by many well-known writers.

The special object of the author, however, in producing this work appears to have been the desire to provide a manual for the use of architectural draughtsmen setting forth in simple language and without the use of higher mathematics an explanation of the origin of formulæ and graphical methods in common use, and of the mechanical principles with which architects are called upon to deal in structural work.

The book covers a wide range of subjects, which are discussed very clearly and quite in accordance with the standard of simplicity laid down by the author. While giving all the theory of the general subject that is required in architectural practice, it may also be recommended as a helpful and systematic handbook for the young structural engineer. The volume is excellently produced and amply illustrated by diagrams and drawings.

The Steel Square and Its Uses Simply Explained. (London: Cassell & Co., Ltd. 1912. Pp. 119. 2s. net.)

A SMALL but eminently practical guide to the use of the modern steel square in carpentry and joinery, with clearly-written instructions for setting-out roofs of various kinds, staircasing, and other work. The text is amply illustrated, and deserves to be in the hands of every craftsman who has not yet learned to appreciate the value of the instrument of precision which is now available as the successor of the old-fashioned iron square.

Bevels and Cuts. By EDWARD HARDY. Illustrated by 228 diagrams. (London: Cassell & Co., Ltd. 1912. Pp. 148. 2s. net.)

STUDENTS of carpentry and joinery, and those who are engaged in practising or teaching these arts, may well be commended to study this little volume, which describes a scientific method whereby the artisan can find the required angles in such position that bevels can easily be adjusted to them, and whereby his lines can be developed on the piece of timber which has to be cut. In addition to being based on scientific principles, the method presents the advantage of being applicable without the aid of a drawing-board and materials. Numerous practical examples are given, and the carefully-drawn diagrams throughout the text constitute a valuable feature of the book.

Pattern-Making. By JOSEPH G. HORNER, A.M.I.Mech.E. Fourth edition; about 500 illustrations. (London: Crosby Lockwood & Son. 1912. Pp. 404. 7s. 6d. net.)

As a rule, architects either omit the design of castings from their practice or are content to leave purely technical details to experts. Consequently, the art of pattern-making, so thoroughly expounded in this well-known treatise, does not appeal to a large proportion of our readers. To engineers a sound knowledge of pattern-making is important, as it necessarily has direct bearing upon the design of details in construction.

Having been engaged for many years as a practical pattern-maker, Mr. Horner is well qualified to write on the subject, and those desiring information on the subject cannot select a better manual than the present edition of his comprehensive work.

Modern Destructor Practice. By W. FRANCIS GOODRICH, A.I.Mech.E., F.I.S.E. One hundred and sixteen illustrations. (London: Charles Griffin & Co., Ltd. 1912. Pp. 278. 15s. net.)

MR. GOODRICH is already known as the author of a standard work on refuse disposal, which dealt with the position as is stood some eight years ago. The present volume is a review of modern practice in refuse disposal both in this country and abroad, and may be studied with profit by all who are practically interested in the question discussed. One gratifying feature brought out is the proved superiority of British destructors in many countries where they have been employed under difficult and widely varying conditions. It is distinctly unsatisfactory, however, to find that the efficiency and sanitary nature of modern methods of refuse disposal are still disregarded by so many of the local authorities in this country.

Second Supplement to the Third Edition of The Law of Building Engineering and Shipbuilding Contracts. By ALFRED A. HUDSON, K.C., Barrister-at-Law. (London: Sweet & Maxwell. 1912. Pp. 30. 5s. net.)

THIS Second Supplement to this well-known treatise consists of a full report in all the Courts, including the House of Lords, of the case of Roberts *v.* Hickman & Co., the decision of which was given in the House of Lords, May 9, 1911. In connexion with this case the author in a Preface draws the attention of architects and engineers who are called upon to give certificates which are binding upon both parties to the necessity of maintaining a strictly independent and judicial attitude. This case, which does not appear to have been reported in the "Law Reports," is of extreme importance to those like architects and engineers who are called upon to exercise these quasi-judicial functions in giving certificates, and they should seize the opportunity offered by this report of the case of considering the judgments delivered in the House of Lords and the Court of Appeal, which are very instructive. We are not aware whether the case is elsewhere reported, so for obvious reasons we only refer our readers for the facts to the volume now published.

CORRESPONDENCE.

Southwark and St. Paul's Bridges.

SIR,—Referring to your "Note" in the issue for May 17, headed "Southwark and St. Paul's Bridges," it is not *now* that the City Corporation recognise the claim of architecture in bridge design, as upwards of two years ago the Bridge House Estates Committee received an influential deputation from the Institute, comprising architects, painters, and sculptors, and promised them that advice would be sought before designs for the bridges were decided upon.

This stage has *now* arrived, and, in accordance with the promise, they have sought the assistance of Sir Ernest George as adviser, in conjunction with Mr. Mott, the engineer in connexion with Southwark Bridge, which is to be proceeded with at once, and have retained the services of Sir William Emerson as assessor in matters relating to the St. Paul's Bridge.

J. DOUGLASS MATHEWS,
Member of the Committee.

The Royal International Horticultural Exhibition.

SIR,—I was rather surprised on visiting this exhibition to notice what little attention had been paid to the revival of formal gardening in England. It is true that there was the usual display of cut bushes both in yew and box, but as to garden ornament, apart from work designed and exhibited by Messrs. Cashmore & Co., and some antique work exhibited by another firm, which, by the way, rather savoured of vandalism, there was nothing to arrest attention.

I had the same feeling when I was looking at the garden furniture; there seemed to be no originality in the designs.

I do not know whether this exhibition is to become an annual one, but if it is, might it not be possible for a separate section to be formed, displaying plans, drawings, and models of modern gardens by modern artists? I feel sure such an adjunct to the exhibition would be appreciated by a large section of the public.

A VISITOR.

EDITORIAL SUMMARY.

"Removal and Reconstruction" is the title of the leading article.

"Sculpture at the Royal Academy" is the title of our second article (p. 622).

In "Notes" Column (p. 623) will be found comments on: "The London Society and Public Opinion"; "Beauty and Utility"; "Liverpool Custom House"; "The Legacy of the Lack of Forethought"; "The Old Town Hall Façade, Manchester"; "Façade or Building?"

An article on American Collegiate Architecture, dealing with the drawings shown by Mr. R. A. Cram at the Royal Institute of British Architects, appears on p. 624.

A review of the pictures at the New English Art Club Exhibition is given on p. 624.

An illustrated article on the work of Friedrich Ohmann appears on p. 625.

A report of a meeting of the new London Society will be found on p. 627. A paper by Mr. T. Raffles Davison is given in connexion with the report.

Under Architectural Societies (p. 631) a notice of the "Manchester Society of Architects" appears.

Book notices (p. 633) include: "The Mechanics of Building Construction"; "Elementary Principles of Reinforced Concrete Construction"; "The Principles of Structural Mechanics"; "The Steel Square"; "Bevels and Cuts"; "Pattern-Making"; "Modern Destructor Practice."

In Correspondence Column (p. 633) will be found letters on: "Southwark and St. Paul's Bridges"; "The Royal International Horticultural Exhibition."

A second article on the Adelphi Hotel, Liverpool, with illustrations, is given on p. 635.

The Building Trade Section (p. 638) includes: "The Insurance Act"; "Concrete Mixing"; "Electricity in the Stoneyard"; "Projected New Buildings in the Provinces," etc.

In Legal Column (p. 643) are notes on: "Landlord and Tenant"; "Workmen's Compensation"; "Party Walls: London Building Act"; "London Drainage By-laws"; "Landlord *v.* Tenant."

Law Reports (p. 645) include: "Wallis *v.* Biddulph"—ancient lights and Crown leases; "Dawnay *v.* Mulholland"—claim against a building owner; "Clinch *v.* Jackson"—Referee on time-sheets; "Marylebone Borough Council *v.* White"—case under the Metropolis Management Acts.

MEETINGS.

FRIDAY, MAY 31.

Junior Institution of Engineers.—Mr. Arthur Bourne on "Standardisation of Engineering Catalogues."

MONDAY, JUNE 3.

Royal Institute of British Architects. Mr. Wm. Woodward on "The Responsibilities of Architects and the case of Muter *v.* Waldstein." 8 p.m.

The Society of Engineers (at the Institution of Electrical Engineers, Victoria-embankment).—7.30 p.m.

WEDNESDAY, JUNE 5.

The Institution of Municipal Engineers.—Visit to premises of Messrs. Doulton & Co. 2.30 p.m.

THURSDAY, JUNE 6.

The Institution of Water Engineers.—Summer general meeting, Cheltenham.

FRIDAY, JUNE 7.

The Institution of Water Engineers.—Summer general meeting, Cheltenham.

The Institution of Municipal and County Engineers.—Scottish district meeting, Albert Hall, Stirling.

BOOKS RECEIVED.

FARM BUILDINGS. By C. E. Curtis. (London: Vinton & Co. 3s. 6d. net.)

CONCRETE COSTS. By F. W. Taylor and S. E. Thompson. (New York: J. Wiley & Sons; London: Chapman & Hall. $5·00; 21s. 1d. net.)

COMPETITION NEWS.

Federal Capital City, Australia.

We have referred repeatedly to the facts which have made this competition so unsatisfactory, and in our issue of May 3 (p. 513) we printed a letter from the Secretary to the Royal Institute of British Architects explaining the reasons why British architects probably would not feel able to compete. The winners of the competition have now been announced, and we can only hope that the result is as satisfactory to the promoters as the affair has been disappointing to those who under other conditions would have entered the lists. The first prize (1,750*l.*) has been awarded to Mr. Walter Burley Griffin, Steinway Hall, Chicago; the second (750*l.*) to M. Eliel Saarinen, Helsingfors, Finland; the third (500*l.*) to M. Alfred Agache, 11, Rue Eugène Flachat, Paris. "The awards were made on the recommendation of a majority of two out of three judges," says the *Times*, and we await the official report of the proceedings. The assessors were Mr. J. H. Smith (Engineer), Mr. John Kirkpatrick (Architect), Mr. J. M. Coane (Surveyor).

The Whiteley Homes.

We are informed that a meeting of the trustees of the Whiteley Homes was held on Saturday, May 18, at Fox Oak, Burhill, near Hersham, at which the schemes submitted in the limited competition for plans for laying out the site for the homes (in future to be known as "Whiteley Park") were considered, and it was decided that the plan sent in by Mr. R. Frank Atkinson, F.R.I.B.A., contained the best suggestions for the purpose. Mr. Walter Cave, F.R.I.B.A., was the assessor.

Welsh National Memorial Sanatoria.

The King Edward VII. Welsh National Memorial Association for the Prevention and Abolition of Tuberculosis in Wales and Monmouth (which has this week been granted a Charter of Incorporation) is arranging for the provision of institutions in North and South Wales for the furtherance of the campaign. As will be observed from our advertising columns, the Memorial Association is now inviting applications from architects for the erection of a sanatorium in South Wales for 250 beds, and one in North Wales for 150 beds. Further information, upon which architects can prepare the necessary pencil sketches and supply other details, can be obtained from the Secretary, Welsh National Memorial Offices, Newtown, Montgomeryshire. We see no reference so far to the appointment of a professional assessor, and until this question is settled we advise intending competitors to refrain from proceeding.

Society of Architects.

Mr. F. Morrell-Maddox, of Burton-on-Trent, has been awarded the Travelling Studentship (25*l.* and Silver Medal) of the Society of Architects. The subject set was "A Town Hall to cost not more than 30,000*l.*"

Exhibition of Mural Paintings.

An exhibition of designs for mural paintings and for the decoration of schools and other institutions will be held at Crosby Hall, More's Garden, Chelsea, from June 3 till June 22, 12 noon to 8 p.m. The competition designs for which prizes were offered will be included.

Benfieldside Sewage Disposal.

Last year the Benfieldside Urban District Council invited five engineers to submit competitive designs for sewage disposal works. These schemes were referred to Dr. Hill, County Medical Officer of Health, who considered the best scheme was that prepared by Messrs. Taylor & Wallin. The Council have now accepted this scheme, and have engaged the engineers for the execution of the works. The whole of the sewage will be dealt with by gravitation, and no pumping will be needed. The estimated cost of the works, including the purchase of land, will probably be between 9,000*l.* and 10,000*l.*

Proposed School at Stebonheath, Llanelly.

Unforeseen circumstances have intervened to prevent the Education Committee of Llanelly proceeding for the time being with the competition for designs for the above school. The advertisement was issued in the early part of May, and the date given for sending in designs was July 1.

New Chester-road Proposed Council School, Port Sunlight.

With regard to this competition, we are informed that objection was taken by the Liverpool Architectural Society to the conditions of the competition, and owing to the urgent need for further school accommodation the County Authority found it necessary to abandon the competition and to proceed at once to appoint an architect from among the gentlemen who had submitted their names in respect to the proposed competition. Messrs. George Bradbury & Sons, 14, Cook-street, Liverpool, were the architects appointed.

Government Palace, Montevideo.

The following information has been circulated in France, and although neither the officials of the Board of Trade nor of the Uraguay Legation in London are able to confirm it, there seems no doubt that the facts are correct. The amounts of the premiums, however, are different to those originally published in this country. The award has been notified in France as follows:—First premium (20,000 francs) to M. Nénot, member of the Institute of France, with whom is associated M. Ebrard. (An article on the work of M. Nénot appeared in the *Builder*, November 19, 1910.) Two second premiums of 15,000 francs each to M. Erro (Uraguay) and M. Carré (France). Two third premiums of 10,000 francs each to M. Pittamiglio (Uraguay) and M. Summaruga (Italy). The award in the competition for a town improvement scheme for Montevideo has yet to be made.

ILLUSTRATIONS.

The Work of Professor Ohmann.

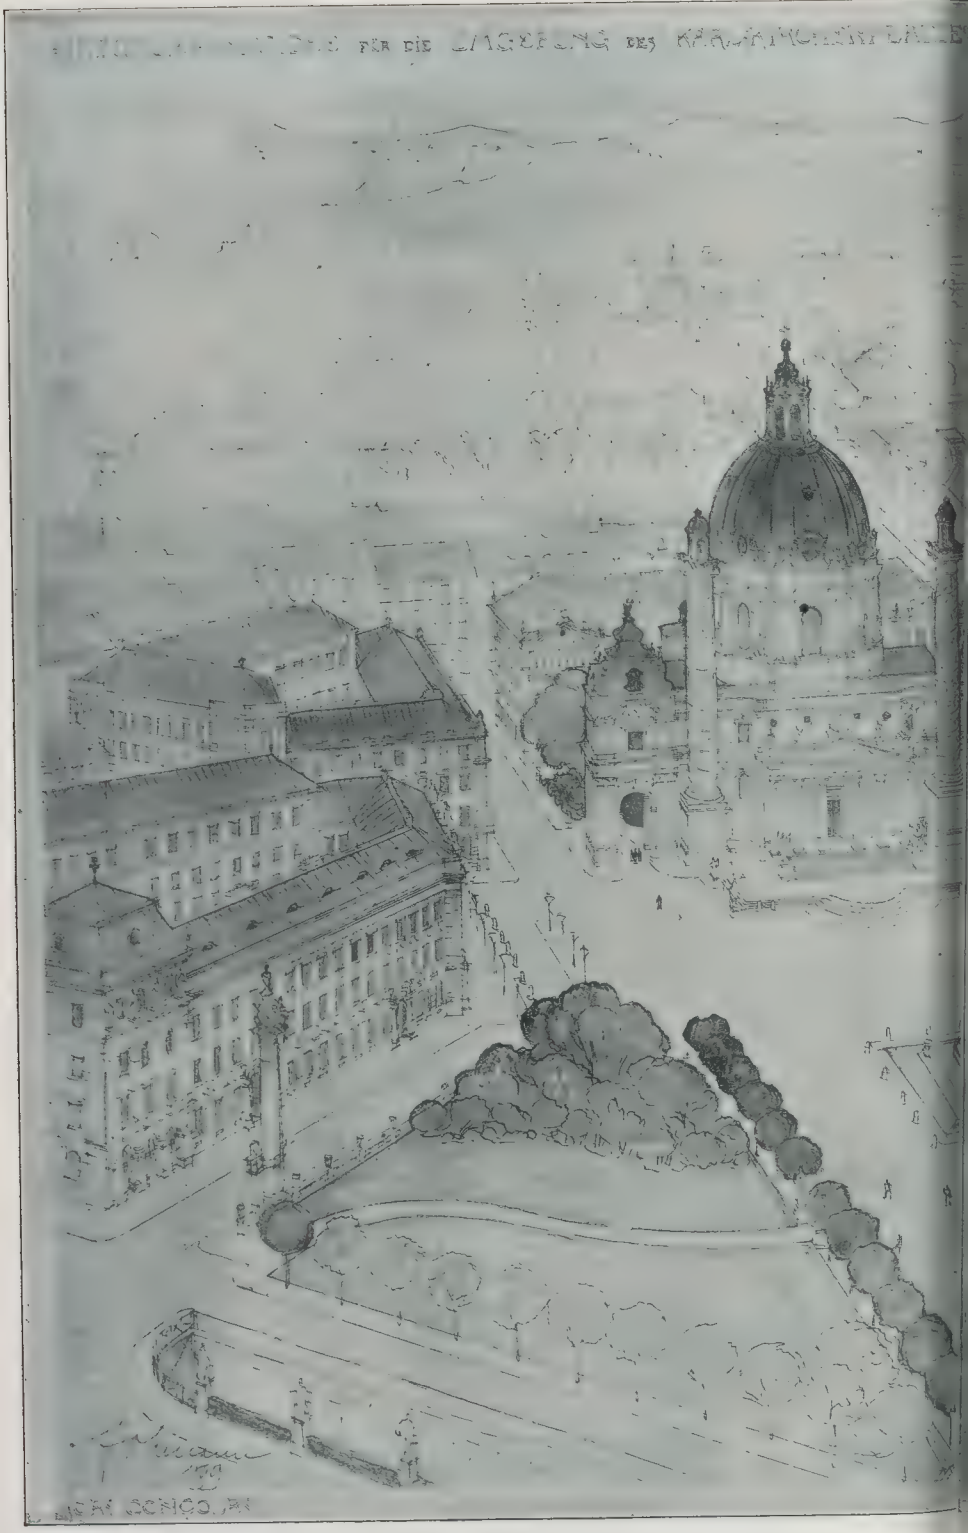
FULL reference is made in the article beginning on page 625 to the designs and buildings of Professor Friedrich Ohmann, to whose work our plates are devoted this week.

FIFTY YEARS AGO.

From the *Builder* of May 31, 1862.

The Metropolitan Prisons.

SEVERAL of the old prisons which figure in an important way in the pages of the history of London have, even within a comparatively recent period, been disused and demolished. Without enumerating those which have been removed at an older date we may mention the names of the Marshalsea, the Fleet, and the Giltspur-street Compter, which have been last removed; and soon the celebrated "Bench"—the "Queen's Prison"—will be also among the matters of the past. The state-prison at the Tower has been long unoccupied by traitors or conspirators; and the Serjeant-at-Arms is but seldom called upon to take into custody unruly members of Parliament. The Star-Chamber Court, the Palace Court, and other notorious institutions of the ancient times have been abolished; and now new and more enlightened laws in connexion with the confinement of debtors have caused the Whitecross-street Prison to be almost unoccupied, and rendered the Queen's Prison, Southwark, no longer necessary. In consequence, Mr. Waddington has written to the Lord Mayor to say that the Government is of opinion that the prison in Whitecross-street will now be sufficient for the confinement of all the debtors of London and Middlesex, and proposes to bring a Bill into Parliament for the abolition of the Queen's Prison.



TALKIN WATERWORKS.

The Brampton Rural District Council have accepted the scheme prepared by Messrs. Taylor & Wallin (Mr. Harry W. Taylor, A.M.Inst.C.E.), of Newcastle-upon-Tyne and Birmingham, for the water supply of the parish of Talkin, Cumberland. The water will be taken from the main of the Council's large scheme, also carried out by Messrs. Taylor & Wallin, and conveyed through the village to a pressure maintaining tank.

ADELPHI HOTEL, LIVERPOOL.—II.

(Continued from page 554.)

DRAINAGE SYSTEM AND SANITARY FITTINGS.

FROM the drawings and particulars given in our first article it may be gathered that the system of drainage in the new portion of the Adelphi Hotel is one of onsiderable magnitude.

The entire system of rainwater, waste, and oil pipes, and the main drains connected with the sewers, were designed by the architect, Mr. R. Frank Atkinson, who adopted the nusual course of preparing a complete set f ½-in. scale working drawings showing everyhing in full detail for the guidance of the ontractors, Messrs. Davis, Bennett, & Co., of Vestminster.

These drawings, which were approved by the ity Engineer of Liverpool, contain several ovel features and may justly be regarded s embodying an ideal installation for a buildng of the kind.

The rainwater pipes and heads are of ead, the pipes having specially-designed ountings and ears, and the heads were deigned to suit the general architectural scheme.

The waste, soil, ventilation, and anti-siphon ipes are of cast-iron throughout the building, ne metal being ⅝ in. thick and the pipes lined nside with glass. In order to ensure permaent efficiency the joints were made without ne use of caulking yarn; and to provide ready eans of cleaning the pipes access doors are itted at all junctions and changes of direction.

The main vertical pipes are placed in conenient situations where they are out of sight, nd fitted so that they can be cleaned from nd to end if required. Internal areas are ised as far as possible for the grouping and ollection of the pipes, and the system includes eneral provision for gulleys, traps, manholes, nd all other auxiliaries requisite for mechanical nd sanitary efficiency.

All branch waste, soil, and ventilation pipes re placed in spaces provided between the lse ceilings of toilet-rooms and the floors of the oms above, the spaces in question being 2 ft. eep, while means of access to each space is rnished by a circular trap-door in the ceiling. ne branch pipes are fitted with a sufficient mber of gun-metal screwed plugs to enable very part of the pipes to be swept or otherwise eansed as occasion may demand.

All exposed service, waste, and other pipes nnected with bath and lavatory fittings e plated and furnished with all requisite cilities for cleaning purposes.

It would be impossible to give a comprensive description of the drainage system as whole without reproducing a series of drawings nich even on a greatly reduced scale would cupy far more space than we have at disposal. oreover, such illustrations could only be of mparatively limited interest, in the sense at they would merely represent the general sposition of the pipes in one particular ilding.

Therefore we consider a more useful proedure is to illustrate a few representative tails selected from the complete set of detail awings placed at our disposal by the chitect.

Fig. 1 is a vertical section through a typical ries of the toilet-rooms in the suites of apartents mentioned in our previous article.

At the left hand are a 4-in. soil pipe for the osets, and the anti-siphon pipes for closets d lavatory basins respectively. At the right nd are a 3-in. waste pipe and an anti-siphon pe for baths.

It will be noticed that the main pipes are clined at a slight angle from the vertical, this rangement having been necessitated by the sition of structural members in the steel me of the building. The only alternative uld have been to fit the pipe in successive ps by using swan-neck bends, a course very desirable owing to the consequent restriction flow and the large number of access doors volved. The present inclined arrangement

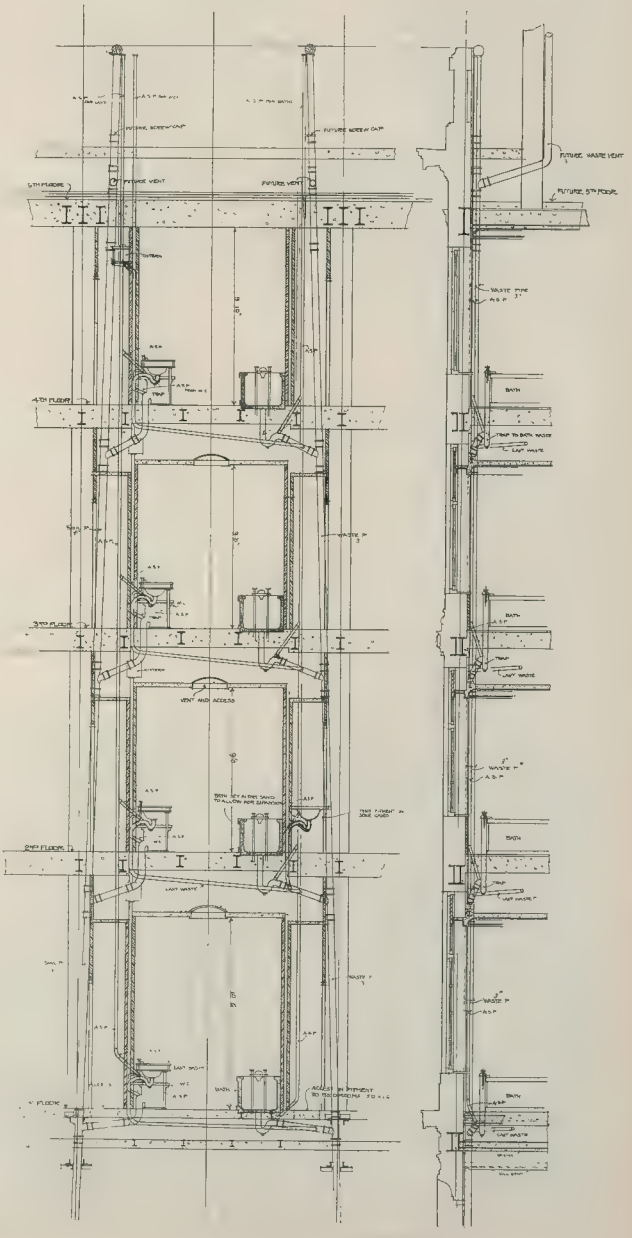

Fig. 1. Detail of Sanitary Fittings, etc.

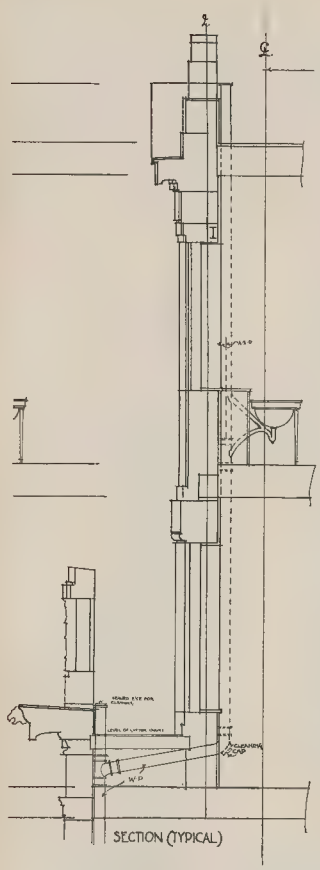

Fig. 2. Typical Section of Sanitary Fittings.

has made each main pipe quite straight in itself. Therefore any of these pipes can be readily swept from end to end, and after removing the top cap and the bottom joint piece it would be possible to look right through the pipe.

We may here explain that the drawing from which Fig. 1 is reproduced was prepared at a time when the idea was to leave the fifth and sixth stories for erection at a later date. The subsequent decision to build these stories with the lower part of the building involved the alterations shown by the typical section forming Fig. 2. It will there be seen that the top of the original pipe is closed by a sealed eye for cleaning, while the offset extension has a cleaning cap and is carried to the level of the upper parapet.

Reverting to Fig. 1, the reader should notice the details of the manhole and soil pipe connexions and the gulley fittings for waste pipe, and also the details of the chambers for branch pipes between each floor and the false ceiling of the toilet-room below. In addition to providing for pipes, these chambers accommodate the supply cisterns for closets, the down pipe being concealed behind a partition, which also hides the connexion operating the cistern valve and taking the place of the familiar unsightly chain. The domed access doors to the pipe chambers are perforated and act as ventilators to the toilet-rooms.

Fig. 3 is a typical plan showing the arrangement of the toilet-rooms for suites of apartments, and Fig. 4 is a typical plan of one of the general toilet-rooms for visitors occupying apartments without accommodation of the kind.

On the fifth and sixth floors, where none of the bedrooms have bath and toilet rooms the general toilet-rooms at various points are of larger size to obviate the risk of inconvenience to the staff and visitors.

It will be remembered by those who have read our former article that all bedrooms are fitted with lavatory basins supplied with hot and cold water. The drainage system for these and for the fittings in the chambermaids' and service rooms is generally similar to that already described and need not be illustrated specially.

To elucidate further the character of the drainage connexions in the basement of the hotel, we give in Figs. 5 and 6 two representative sets of details from the architect's drawings.

Fig. 5 is a plan of one of the four small areas beneath the terrace around the fountain court. The arrangement here shown is generally typical of that in similar areas where rainwater, waste, and soil pipes, and surface drains are connected with one general branch drain pipe.

In the case of the area now in question this pipe is of 6 in. diameter and proceeds to the manhole adjacent to column No. 21a where, as shown in Fig. 6, it is connected with the 6-in. main drain pipe discharging into the sewer on the Brownlow-hill side of the building.

Fig. 6 includes a plan and sections illustrating the details of the manholes provided at frequent intervals along the same side of the hotel for the connexion of down pipes with the main drain. Similar arrangements have been made on the Copperas-hill side and elsewhere.

The drainage system in the upper stories provides for the waste from some 200 bath-rooms, in addition to that from a very large number of lavatories, sinks, and closets. In the lower stories the system has to perform the still greater duty of carrying the drainage from

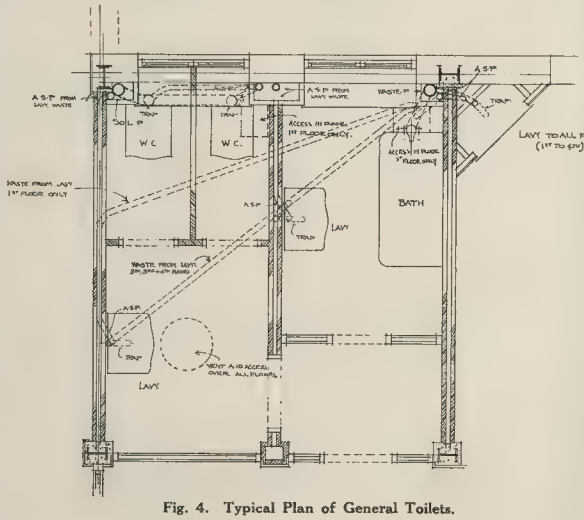

Fig. 4. Typical Plan of General Toilets.

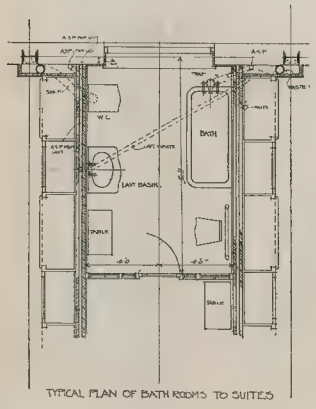

Fig. 3.

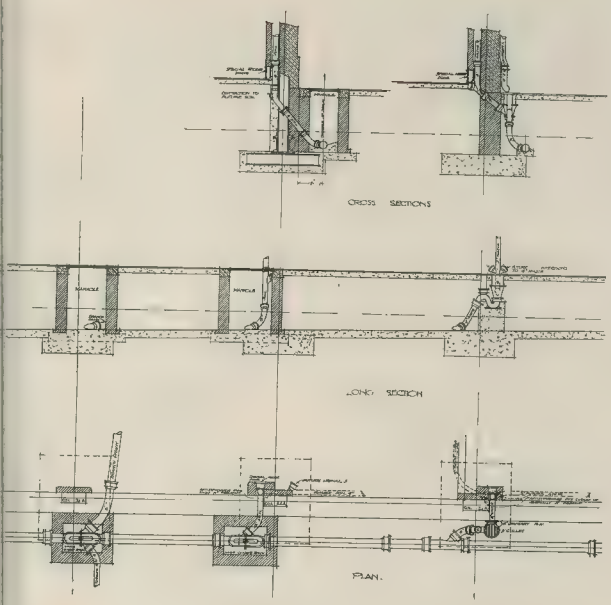

Fig. 6. Detail of Drainage to Brownlow-hill Side.

erous sanitary and domestic fittings as as from the boiler-house, laundry, and nen department. Adding to all these ainwater drainage from the entire building, ll be realised that the installation is one ery considerable magnitude, the design of h has evidently involved much labour and nate knowledge of technical details.

ter careful consideration the sanitary gs of Messrs. Davis, Bennett, & Co. were ted by the architect, subject to modifica- required to bring them into harmony the architectural treatment of the .

e lavatory basins, baths, and closets are hite glazed fireclay, all provided with d fittings. The lavatory basins have t lever action dome top accessible com- pull-up standing wastes and overflows, re fixed on plated stands 1½ in. away from valls to obviate any unsightly cutting of or surface work, and to enable the chamber- s to dust behind them. The service and pipes and traps are plated and arranged at they pass through the floors at one in the tiling.

every bedroom a lavatory basin with ascata marble top is provided instead of istomary washstand, and in the enclosure the basin there are two fireclay receptacles toilet chambers. The fitting includes ted swing two-arm towel rail, a glass for water bottle, and soap-tray of special n. The constant supply of hot and cold is a great convenience to visitors and s a considerable reduction in the amount tendance demanded from the staff.

baths are of somewhat unusual form, approximately rectangular, as shown igs. 3 and 7. They are specially deep , but this feature gives rise to no incon- nce, as the baths are fitted so that the n is slightly below floor level. With the of ensuring cleanliness and preventing cumulation of dust, the baths are fitted he walls and floors, in pursuance of the idea which has been carried out in con- with wardrobes and toilet-tables. s complying with hygienic principles, system reduces the work of cleaning considerable extent. The baths can be or emptied within sixty seconds.

closet pans are nearly 1 in. thick and an exceptionally large water area. The cisterns, which, as previously mentioned, aced in the pipe chambers above the eilings, are noiseless in action, and are ed by means of plated side pulls in f the customary hanging chains.

All the sinks in the chambermaids'-rooms and service-rooms are of Messrs. Davis, Bennett, & Co.'s usual hotel patterns, a special flushing jet being fitted to each sink trap to obviate the risk of stoppage. The sinks provided for charwomen have 3-in. glass-lined traps, each with a 1½-in. flushing pipe connected directly to the trap and entirely separate from the flushing pipe provided for the sink itself.

The whole of the sanitary and plumbing work in the hotel was executed by Messrs. Davis, Bennett, & Co., of Westminster, under the direction of their foreman-in-charge, Mr. T. Berkham, and we are informed that the contract for a similar installation in the second part of the hotel about to be built has been entrusted to the same firm.

Since the publication of our first article we have been informed that the asphalt of Messrs. Thomas Faldo & Co., Ltd., was employed at the Adelphi Hotel in the form of horizontal and vertical damp-courses throughout, for the waterproofing of the roofs, and of all cornices and balconies, and for the special purposes mentioned below. One of the latter was the formation of a lining carried up the back of the masonry from the level of the horizontal damp-course to roof level, this being a feature which appears to be a novelty in building construction. The lining of the fountain court and the fountain basin were executed in the same material, which was also used beneath the circular skylights to the fountain court with a hidden gutter to carry away water of condensation. The asphalt supplied by the firm mentioned was their "pure natural genuine Seyssel asphalt."

We are also informed by the architect that Messrs. Cooper, Wettern, & Co., Ltd., supplied and fixed the granite for part of the basement story in the Adelphi Hotel.

BATTLE OF LARGS MEMORIAL.

The monument to commemorate the battle fought between Alexander III. and Haco III., King of Norway, in 1263, will be erected on the foreshore of Lord Glasgow's land at Largs. The memorial has been designed by Mr. J. S. Kay, of Glasgow, architect, and consists of a reduced reproduction, 66 ft. high, of the round tower (which exceeds 100 ft. in height) at the side of Brechin Cathedral, to be constructed of local whinstone, with the doorway and its details of white freestone. The doorway will be 8 ft. above the ground level, and will present an exact copy of the carvings of the original at Brechin.

GLOUCESTER AND STROUD TECHNICAL SCHOOLS.

A party of students from the Building Trades Classes at Gloucester and Stroud Technical Schools visited recently several works and buildings at Bristol. The day's work commenced at Messrs. Reve Brothers' Lead Works at Cannons-marsh. A visit was subsequently made to Messrs. C. Jennings & Co.'s Joinery Works. Mr. Jennings and his son explained each machine. Messrs. Gardiner's Iron Works in Willway-street were next visited. The final visit was to the extensions of the Royal Infirmary now in course of completion by Messrs. Cowlin & Son, at a cost of 75,000*l*. Amongst those accompanying the party were Mr. R. Leach, B.Sc., headmaster of the Gloucester Technical Schools; Mr. T. Newsome, headmaster of the Stroud Schools; Mr. W. F. Wakeford, teacher of plumbing; and Mr. K. H. Read, lecturer on building construction and builders' quantities at both schools, who was responsible for the arrangement of the visit.

Fig. 7. Adelphi Hotel, Liverpool: Typical Bath Room.

THE BUILDING TRADE.

THE INSURANCE ACT.

AS it seems probable that the Insurance Act will now come into force on July 15 next, and that the public will have to do the best they can in unravelling its provisions, it may be well to consider that portion of the Act which relates to unemployed insurance, as this particularly affects those engaged in the building trade.

Sect. 84 provides that every workman who is unemployed, having been employed in a trade mentioned in the Sixth Schedule of the Act referred to as an "insured trade," shall, subject to the conditions laid down in the Act, be entitled to receive "unemployed benefit" as authorised by the Seventh Schedule, provided that no unemployment benefit shall be paid in respect of any period of unemployment occurring within six months of the commencement of the Act. The employer, who, as will be shown, is liable in the first instance to pay the contributions, will, therefore, first have to ascertain what is an "insured trade" within the meaning of the Act.

In the Sixth Schedule there are seven trades scheduled, viz., building, construction of works, shipbuilding, mechanical engineering, iron-founding, construction of vehicles, and saw-milling. It is not necessary for us to consider all these in detail, but "building" is described as "the construction, alteration, repair, decoration, or demolition of buildings, including the manufacture of any fittings of wood of a kind commonly made in builders' workshops or yards."

"Construction of works" as "the construction, reconstruction, or alteration of railroads, docks, harbours, canals, embankments, bridges, piers, or other works of construction." "Saw-milling" (including machine woodwork) is described as being carried on in connexion with any other insured trade or of a kind commonly so carried on.

It is obvious that under these definitions questions will arise similar to those which were raised under the Workmen's Compensation Act of 1897.

When the Bill was in Committee various questions were put to the Solicitor-General, as, for instance, whether under the definition of "building" drainage work would be included, also the fitting of a corrugated iron roof. Questions such as these have usually had to be determined by the Law Courts, but by sect. 91 of the Act the Board of Trade has power to make regulations for, amongst other things, giving employers and workmen an opportunity of obtaining the decision of an umpire appointed under this part of the Act whether contributions are payable in respect of any workman or class of workmen. Under this section regulations were made on March 26, and under these regulations a number of applications have been made to the umpire for decision. So far, only two decisions of interest to those engaged in the building trades have been published. The umpire has decided that contributions are payable in respect of workmen employed in washing ceilings, stripping off paper in buildings, whitening, colouring, repairing, pumicing woodwork, and general preparations for painting; but that contributions are not payable in respect of workmen employed in making stock bricks by machinery and in the burning of bricks in open clamp kilns.

A number of other applications which will be of interest to those engaged in the building trades yet await decision which we shall refer to on a future occasion.

When the question has been determined what is an "insured trade" the next question for the employer to consider is what is a "workman." This word is defined in sect. 107 more or less in terms made familiar by the Workmen's Compensation Act: "Any person of the age of 16 or upwards employed wholly or mainly by way of manual labour who has entered into or works under a contract of service with an employer, whether the contract is expressed or implied, is oral or in writing." By sect. 103 the Board of Trade has power by order to vary the age. The cases decided under the Workmen's Compensation Act will serve to elucidate most of the terms in the above definition, but the question which will most occupy the mind of the employer —especially when he employs navvies in the construction of works—is, what about casual labour?

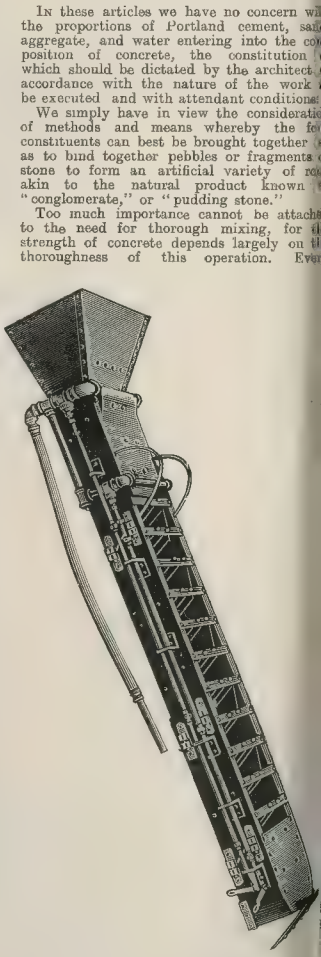
This question will, we think, cause considerable difficulty and trouble. The workman to be entitled to claim unemployment benefit has, under sect. 86, to prove that he has been employed as a workman in an insured trade "in each of not less than twenty-six separate calendar weeks in the preceding five years"; but under sect. 85 subsect. (2) every employer of workmen in an "insured trade" is made liable to pay contribution at the rates specified in the Eighth Schedule, that is, in the case of an adult workman, 2½d. "for every week he is so employed." The schedule, however, also provides: "Every period of employment of less than a week shall for the purposes of this Schedule be treated as if it were employment for a whole week except that where the period of employment is two days or less the contributions both of the employer and of the workman shall be reduced to 1d. if the period does not exceed one day and to 2d. if it exceeds one day." By sect. 85 subsect. (3) the employer has, in the first instance, to pay both the contribution of himself and the workman, and then can deduct the workman's contribution from his wages. In these days of labour unrest and trade union agitation, the Act thus imposes upon the employer the unenviable duty of haggling with every person employed for but one day over a penny deduction from his wages. By the Unemployment Insurance Regulations, dated April 25, 1912, it is provided that every workman shall obtain from a local office an "unemployed book." The employer has to demand this book from the workman and be responsible for it during the employment, returning it with the stamps affixed at the conclusion of the employment.

There are certain exceptions in the Act relating to those temporarily or casually employed. By sect. 97 a special provision is made "in rural neighbourhoods." "Where a workman is employed in a district which is rural in its character and the workman usually follows in that district some occupation other than an insured trade and is employed in an insured trade occasionally only, contributions under this part of the Act shall not be payable in respect of the workman," except by agreement between the employer and the workman.

By sect. 107 subsect. (1) temporary work provided by a Central Body or Distress Committee under the Unemployed Workmen Act, 1905, or towards the provision of which such bodies have contributed under that Act, shall not be deemed employment in an insured trade. It may also be noted that by subsect. 2 it is provided that "in determining any question as to whether any trade in which a workman is or has been employed, is an insured trade or not, regard shall be had to the nature of the work in which the workman is engaged rather than to the business of the employer by whom he is employed."

This provision seems to complicate the position of the employer who, it must be remembered, is, by sect. 101, liable to penalties if he fails to pay any contribution for which he is liable under the Act. An employer could satisfy himself once and for all whether the business he carries on is or is not an "insured trade," but that subsidiary operations may come within the Act is proved by sect. 104, which enables the Board of Trade to make orders excluding subsidiary operations from the occupations which are to be deemed employment in an insured trade. This subsection, however, in ordinary cases appears to place upon the employer the onus of determining whether the particular class of work a man is put to brings him within this part of the Act.

In the present article we have endeavoured to explain the primary obligations imposed upon employers under this part of the Act, but such is the complication of this measure that we must confess that any attempt to explain its provisions appears but to emphasise its inherent difficulties. In addition to the contributions levied under the Act, it would appear likely that in large works it will involve the employment of a special insurance clerk, or even of staff of clerks. Whilst the Legislature seems alive to the increased cost of living and articles produced by labour, and suggests consequent artificial increase of wages, appears to overlook the fact that it is legislation of this character, complicated and involving large administrative expenses, which fetters employment and adds to the cost of production whilst it in no way satisfies those who receive the benefits. Were there no Workmen's Compensation, no Old Age Pensions, no Insurance Act (though we express no opinion whether such provisions are desirable or not) wages would be higher and the cost of production less and an increase in wages would pacify labour in a way which statutory benefits fail to accomplish.



CONCRETE MIXING.—I.

Introduction.

IN these articles we have no concern with the proportions of Portland cement, sand, aggregate, and water entering into the composition of concrete, the constitution of which should be dictated by the architect in accordance with the nature of the work to be executed and with attendant conditions.

We simply have in view the considerations of methods and means whereby the few constituents can best be brought together so as to bind together pebbles or fragments of stone to form an artificial variety of rock akin to the natural product known as "conglomerate," or "pudding stone."

Too much importance cannot be attached to the need for thorough mixing, for the strength of concrete depends largely on the thoroughness of this operation. Every

Gravity Concrete Mixer.

particle of sand ought to be coated with cement, and every fragment of aggregate coated with cement and sand, while all voids between the particles of sand should be filled with cement, and all voids between

e fragments of aggregate filled with cement
d sand.
Imperfect mixing can only have the result
leaving excessive quantities of mortar
tween the surfaces of the aggregate in
me parts, and of leaving the aggregate in
her parts with an insufficient amount of
nding material. An excess of mortar
duces compressive strength because mortar
not so strong as stone, and deficiency of
rtar reduces both compressive and tensile
ength, but especially the latter, because
e particles of aggregate lack cohesion.
Thus it will be seen that even the costly
vice of trying to make amends for
ticipated imperfection of mixing by increas-
g the proportion of cement cannot be
tirely successful.
A far better alternative is to spend money
mixing rather than in an excessive
nount of cement. Lest any reader should
rry away a wrong impression, we add the
nark that by an "excessive amount" is
eant any quantity over and above that
nply adequate for filling and coating the
nd, and for helping to fill and coat the
gregate. If the original proportions are
or in cement, then an increased proportion
that constituent will certainly result in
reased strength up to the stage where
e sand and aggregate are completely filled
d coated.

Hand and Machine Mixing.

At the present time it is generally admitted
at hand mixing is less efficient than
achine mixing. Good concrete can un-
ubtedly be produced by hand labour under
reful superintendence. But the work is of
newhat uninteresting nature, and the men
gaged on it are apt to think less of
ficiency than of the monotonous task of
ntinually turning over the materials, and
ey usually welcome the little change of
cupation awaiting them on the completion,
imagined completion, of each batch. The
eriority of hand mixing is recognised by
ne specialists who make a practice of
cifying a larger proportion of cement for
hand-mixed concrete, and careful tests
de in the United States show that the
ength of concrete mixed by hand may
ge from about 50 per cent. to 90 per cent.
the strength possessed by concrete of the
ne composition mixed by machine.
Notwithstanding the superiority of
chanical mixing, hand labour must
ntinue to be employed very extensively by
lders, except in contracts of magnitude
ficient to justify the installation of the
uisite mixing plant.
As our readers are presumably familiar
h every detail of hand mixing, we purposely
tain from discussing this operation.

Gravity Concrete Mixer.

An appliance of American origin introduced
o the United Kingdom, and supplied by
Associated Portland Cement Manu-
urers (1900), Ltd., will be found of
siderable service to contractors having
k in hand which does not justify the
ployment of mixing machinery. Although
en classified as a machine, this appli-
e, of which a view is given, includes
mechanism, and simply consists of a
angular steel tube having a feed hopper
the top and a discharge valve at the
tom, while the interior is provided with
eries of ribs, termed deflectors, on the
es, and a series of grids formed of steel
s. An arrangement of pipes and valves
mits the introduction of water in the form
spray near the middle of the tube. The
gth can be varied from 4 ft. to 10 ft. by
ing or removing spare sections of tube.
To employ this apparatus to the best
antage it should be placed in a slanting
ition, with the feed hopper at the same
el as an elevated platform for the recep-
and gauging materials, and the dis-
rge outlet should be far enough above the
und to enable barrows to be wheeled
derneath to received the mixed concrete.
f the materials are measured on the plat-
m and fed into the hopper by shovels the
aratus operates on what is known as the
ntinuous" system, while if measured in
required proportions and tipped in from
ox in bulk it works on the "batch"
em.
he inventor claims that the violent agita-
caused by the deflection of the materials
their downward passage produces a perfect mixture and yields concrete of great strength.

The apparatus possesses the obvious advantage that no mechanical power is required for its operation, and it may well be taken into consideration by building contractors, as providing a convenient halfway house between hand and machine mixing.

Concrete Mixing Machines.

Concrete is too weighty a material to be effectively mixed in a machine worked by hand power, except in very small quantities. Therefore, the purchaser of a mixer has to provide for its operation by power in the most convenient manner.

An efficient mixer should not merely stir up the mass of materials or treat them by a simple process of churning, but must provide in some way for breaking up the mass and repeatedly transferring portions of it to different parts of the machine, so that the light and heavy particles may be uniformly distributed throughout.

Among the numerous forms of mixing machines on the market the best-known varieties may be divided into two general classes—rotary and paddle mixers.

The rotary mixer comprises a receptacle of cylindrical or other shape fitted inside with deflectors, blades, or other obstructions to uninterrupted movement of the materials, designed so as to cause the greatest possible agitation when the receptacle is being revolved at sufficiently rapid rate of speed.

The paddle mixer consists essentially of an open vessel fitted with blades, which are rotated while the vessel remains stationary, or with fixed blades, which come in operation when the vessel is rotated.

Machines coming into one or the other of these classes differ considerably in respect of efficiency, design, and auxiliary fittings, and it is incumbent on purchasers to make a judicious choice of the apparatus best suited to their individual needs. It is also necessary to see that the output of the mixing plant is sufficient to keep the concrete hands fully employed, and desirable, from the standpoint of economy, not to provide machines of larger capacity than is actually necessary.

Concrete-mixing machines are commonly divided into two classes :—(*a*) continuous mixers and (*b*) batch mixers.

To make continuous mixers thoroughly efficient the materials should be measured and fed automatically. If the dry materials are roughly mixed on a platform, and shovelled into the receptacle in small quantities, there is every probability that the resulting concrete will be of varying quality.

Where batch mixers are employed, the materials are measured in boxes of known capacity and tipped into the machine in the predetermined proportions, thus conducing to uniform quality and entailing less supervision than would otherwise be requisite.

It should be noted, however, that concrete-mixing machines cannot always be definitely placed in either class, because various machines on the market are constructed so as to be available for use in continuous or batch mixing as may be preferred.

(To be continued.)

ELECTRICITY IN THE STONEYARD.

An interesting application of electric motor-driving is to be found at Messrs. C. W. Courtnay's stoneyard, at Swan Wharf, Putney Bridge, and, although the number of jobs to which motors can be applied is limited to all intents and purposes to hoisting and sawing, there can be no doubt about their suitability for this kind of work. Space in a stoneyard is generally rather at a premium, and boilers and small steam engines, with their attendant coal piles, will often occupy enough of it to be a nuisance.

A 10-ton jib-crane with a 66-ft. jib can be slewed out over the barges and can cover the major part of the yard. This crane, which is by Messrs. John Smith & Co., Ltd., Keighley, is driven in a somewhat novel manner

Electrically-driven Stone Saw.

by a 10-h.-p. 3-phase semi-enclosed constant-speed Westinghouse motor, which runs at 930 revolutions off the Fulham Borough mains at 200 volts and 50 cycles. The motor is located in a shed, and is about 16 ft. distant from the crane slewing pivot. A belt drive is taken from the horizontal motor shaft to a vertical shaft beneath the crane. The latter shaft runs up into the crane driver's cab and operates the lifting and slewing gear.

The stone to be cut is levelled up on a trolley travelling on rails, which is then run in underneath the saw frame, which is raised to the upper extremity of its travel to allow of this. The wheels of the trolley are blocked, and the saw frame is lowered on to the top of the stone to be cut. The saw frame is a rectangular structure, to which the steel saw planes can be fitted in any number and at any distance apart. The frame is reciprocated by connecting rods coupled up to each side member and operated from a crank shaft which is rotated by some external source of power. Suspended above saw frames are reciprocating water sprays, which are adjusted to direct a spray of water along the length of each saw cut in order to keep the saws cool and to give a clean cut. At Messrs. Courtnay's yard are two frames, one measuring 14 ft. by 6 ft., and making 160 strokes per minute, and the other 11 ft. by 5 ft., making 175 strokes per minute. The length of the stroke is 10 in. in each case. The rates of cutting vary with the class of stone, its quality as regards hardness, and the number of saws cutting. The hardness of any class of stone may vary within about 25 per cent. up or down; while the number of saws employed is only limited by the degree of thinness to which the slices of stone can be cut. For a two-saw cut, and with a full frame, the larger machine will cut Portland stone of average quality at the rate of about 6 in. per hour, marble at 2 in. per hour, and granite at 1 in. per hour. The downward feed of the saw frames is accomplished by a ratchet movement, and is rendered variable by the provision of change speed wheels similar in principle to those used on screw-cutting lathes.

The maximum feed available is about 18 in. per hour, whilst the minimum may be obtained by simply allowing the saw frame to feed the saws through the stone by virtue of its own weight. Fly-wheels are mounted upon the crank shaft, which operates the saw in order to help the frames over the ends of the strokes. These saw frames, which are also built by Messrs. John Smith & Co., Ltd., are driven through belt reduction gearing by a 25-h.-p. A. C. constant-speed Westinghouse motor.

The absence of attention with which the above-mentioned motors are operated not only results in a great saving in wages over those which would accompany steam-driven machinery, but the cost of running is also greatly decreased, and stand-by losses are reduced to an absolute minimum. The capital expenditure, depreciation, and the ground rent for the space occupied by the power plant are also very much less with electric motor drives than with any other form of motive power.

INCREMENT DUTY.

THE following letter has been sent to Mr. J. H. Kerner-Greenwood, of King's Lynn. His reply is appended:—

"In reference to your letter to my trade paper *re* Increment Duty, I can't quite understand it. In your third paragraph you say under those conditions no Increment Duty is payable. How is it possible for a house to be bought for 400*l.* and sold for 500*l.* without the value of the site increased? What is the best means to distinguish the two values?"

REPLY.

"DEAR SIR,—Yours of the 13th inst. to hand, for which I thank you. Builders every day are taking contracts under cost, and I have many times known builders sell houses under cost in order to get ready-money. If I bought a house for 400*l.*, and a few weeks after sold it for 500*l.*, probably because a doctor wanted it for his special use as it was just the spot for him, it would not necessarily mean that the site value had increased, but that I had used my brain in buying cheaply and selling at a profit. The site value is not altered. It might have been done within a week; in fact, I have known houses like that turned over in a day, but that alters the argument. If it were done in a day, it would not be transferred to the middle man. But I think you have got my idea.

(Signed) J. H. KERNER-GREENWOOD."

GENERAL BUILDING NEWS.

CHRIST CHURCH, BLOOMSBURY.

The Vicar and churchwardens of Christ Church have appointed Mr. S. B. K. Caulfield to make additions to the church, upon the south-western side of Upper Montague-mews. The church was built on the east side of Woburn-square for 800 sittings, after Vulliamy's designs, in the Perpendicular style, in 1832-3. Forty years afterwards the interior was remodelled, and the seating was re-arranged by Mr. Hall.

NEW CHURCH, SUNDERLAND.

The designs for the new church of St. Gabriel's were prepared by Mr. C. Clayton Greene, the architect, of Sunderland, and the building has been erected at a cost of about 12,000*l.* The contract was carried out by Mr. W. D. Allison, builder, of Whitburn.

SEWAGE WORKS, MANSFIELD.

The Duke of Portland performed the opening ceremony of the new sewage works, which have been erected at a cost of about 26,728*l.* by Mr. Mackay, of Derby. The plans were prepared by the late Mr. R. F. Vallance, who was the Borough Surveyor, and the work has been carried on by the present Surveyor, Mr. T. P. Collinge.

CONVALESCENT HOME, CLACTON.

The foundation-stone of this new home was laid on the 10th inst., and the building, which is to be completed in seven months time, is being erected by Messrs. J. Wilmott & Sons, of Hornsey, from the designs of Mr. Fred Rowntree, architect, of Hammersmith. The home will consist of several buildings:—The children's quarters, isolation quarters, manual instruction, etc., rooms, and administration offices. The clerk of the works is Mr. Downing, of Ipswich.

GENERAL POST-OFFICE, EASTBOURNE.

This new post-office has a frontage of about 170 ft. to Apperton-road and 190 ft. to South Fields-road, and is constructed throughout of fireproof material with red-brick basings and Portland stone dressings. On the ground floor are the public offices, sorting-office, staff-rooms, kitchen, etc. On the first floor is the telephone-room, instrument and test rooms, clerks' office, etc. The contractors are Messrs. J. & M. Patrick, of Wandsworth, and the building is being erected under the supervision of H.M. Office of Works.

SHEFFIELD AND DISTRICT CINEMATOGRAPH THEATRES, LTD.

This company have decided to extend the scope of their enterprise by the erection of, in the first instance, a new theatre—to be known as Cinema House—upon an extensive site in Fargate, Sheffield, adjoining the Grand Hotel and opposite the Town Hall. The plans and designs, prepared by Messrs. Hickton & Farmer, of Birmingham, will provide for a theatre having a seating capacity of 1,000, together with a lounge, refreshment, writing, and club rooms, etc. Messrs. Gibbs, Flockton, & Teather, of Sheffield, will act as consulting architects.

NEW OFFICES OF THE MARCONI COMPANY.

Marconi's Wireless Telegraph Company are now in occupation of their new home in the Strand, the building which was formerly the Gaiety Restaurant. The site occupies an area of about 54,500 sq. ft., and the building has nine floors. The main entrance hall off the Strand opens into a waiting-room panelled in Honduras mahogany, and on the same floor a room, measuring 60 ft. by 80 ft. A balcony round this room is occupied by dictaphone machines and their operators, and from it an electric lift for the conveyance of dictaphone records runs to every floor in the building. The ground floor also contains the telegraph office, which is open day and night for the reception of marconigrams. The grand staircase, 10 ft. wide, leads to the first floor, where is to be found the managing director's room with manager's room and accommodation for private secretaries adjoining. The second floor contains the secretary's and accountant's departments and the Board-room. The third floor is given up to the engineering and technical staff, while on the fourth are Mr. Marconi's private room, and the patent, field-station, stationery, and publicity departments. The traffic manager and his staff occupy the fifth floor, the sixth is partially reserved for the housekeeper, and the seventh will contain a workshop, a room for making prints of the drawing office tracings, a photographic dark-room, a drawing office, and large show-rooms, where working sets can be demonstrated. Three lifts, made by Messrs. Waygood & Co., serve the various floors, and for inter-communication between the different rooms there is a system of telephons with nearly 100 extensions, supplied by Messrs. W. G. Hodgson & Co., who also installed the electric bells and fire-alarms. The architects were Messrs. Dunn & Watson, and the surveyors Messrs. T. M. Deacon, Son, & Addiscott. Messrs. Trollope & Colls were responsible for the structural alterations, and also for all the joinery and mahogany screens, and Messrs. F. Geere Howard carried out the electric lighting work.

SWIMMING-BATHS, EAST HAM.

These new baths have been erected at the rear of the Town Hall at a cost of about 8,900*l.* The pond is 120 ft. long by 40 ft. wide, and is constructed with cement concrete retaining walls and concrete floor, the whole being lined with marble terrazzo. The heating apparatus is by Messrs. Royles, Ltd., of Manchester. The bath was designed by the late Borough Engineer, and has been erected by the direct employment of labour under the supervision of the present Borough Engineer, Mr. J. E. W. Birch.

BANK BUILDING, MOORGATE STREET.

Messrs. Dunn & Watson are the architects of the new offices for the British Bank of South America in Moorgate-street. The building will be ready for occupation during the summer.

TRADE NEWS.

Messrs. Wheeler & Sons, ventilating engineers, 14, Victoria-gardens, Notting Hill-gate, London, W., have secured the contracts for heating by electricity and ventilation of St. Michael's Church, Cornhill, E.C., also the ventilation of the electricity works at Avonbank, Bristol, for the Corporation of Bristol.

Vulcanite, Ltd., London, E.C., have acquired the business of Messrs. Watson & Co., of Brentford, and they will be manufacturing at their own works Messrs. Watson & Co.'s Reliance lead and bitumen dampcourse, and their other bitumen and asphalt specialities. In future inquiries and orders for Messrs. Watson & Co.'s specialities should be sent direct to Vulcanite, Ltd., at their offices, 118, Cannon-street, London, E.C., Laganvale, Belfast, or Westinghouse-road, Trafford Park, Manchester.

The **Improved Wood Pavement Company** have been accepted for all the wood-paving contracts at Westminster (fifteen thoroughfares). The company have also been accepted for eight thoroughfares in Kensington, although in five cases their tenders were not the lowest.

Under the direction of Messrs. Jeffery & Lacey, architects, Ashford, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to Wye College, Ashford, Kent.

The Carron Company, Stirlingshire, N.B., have sent us a copy of a large and effective poster in connexion with the Carron Line service, plying between London, Grangemouth, and Bo'ness.

The extensions to the Royal Infirmary, Bristol, are being supplied with Shorland's double-fronted patent Manchester stoves, in faience and with descending smoke flues, by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

AT the last meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Width of Way.

Chelsea.—Building on the western side of Little Cadogan-place, Chelsea, at the rear of No. 65, Cadogan-place (Messrs. W. D. Hodges & Co., Ltd.).—Consent.

Peckham.—Erection of a one-story building between Nos. 31 and 33, Stafford-street, Peckham (Messrs. F. Ward & Sons for Mellin's Food, Ltd.).—Consent.

Width of Way and Projections.

Holborn.—Projecting bases to pilasters on the public way in West-street, Holborn (Messrs. Pilditch & Co.).—Consent.

Width of Way and Construction.

Hampstead. — Bridge across a footpath between the grounds of Hill House and Heath Lodge, North End-road, Hampstead (Mr. T. H. Mawson for Sir W. H. Lever, Baronet). —Consent.

Lines of Frontage and Construction.

Islington, South.† — Temporary one-story ilding at the rear of No. 62, Barnsbury eet, Islington, next to the north-eastern side Thornhill-road (Mr. Heaton Comyn for the apers' Company).—Consent.

Lewisham.—Wood and iron shed at No. 20, pringbank-road, Hither-green (Mr. J. Laird). Refused.

St. George, Hanover-square.—Iron and glass oilter in front of No. 7, Curzon-street, St. orge, Hanover-square (Messrs. Jones & illis).—Consent.

Woolwich.—Temporary wood and glass porch No. 15, Macomo-terrace, Woolwich (Mr. S. Weller).—Consent.

Space at Rear.

Greenwich.—House on the eastern side of aconsfield-road, Greenwich (Messrs. Davis & anuel for Mr. A. F. Yarrow and Mr. F. E. liot).—Consent.

Kennington.—Erection of Nos. 10 and 11, illard-street, Kennington (Messrs. J. A. J. oodward & Sons for Mr. J. Dennis).—nsent.

St. Pancras, West.—Caretaker's living-rooms connexion with a building to abut upon dhill-street and Little Edward-street, St. ncras (Messrs. Pilditch & Co. for Mr. W. S. epherd).—Consent.

Westminster. — House abutting upon the tern side of Tufton-street, Westminster, and northern side of a new street between fton-street and Smith-square (Mr. H. S. G. ndel for Captain H. Adeane).—Consent.

Woolwich.—Conversion of a one-story work-p and office building upon land at the rear Nos. 1 to 29, Vernham-road, Plumstead, o a dwelling-house (Mr. E. H. Wright for . D. Gibson).—Consent.

Separation and Alteration of Buildings.

Clapham.—Alterations at No. 157, High-eet, Clapham (Mr. A. W. Cleaver for City ilors, Ltd.).—Consent.

Cubical Extent.

Walworth.—Motor garage to abut upon tory-place, Walworth (Messrs. Gilbert & nstanduros for Messrs. T. Tilling, Ltd.).—nsent.

St. George, Hanover-square.—Addition to a lding approached from Carrington-street Hertford-street, Mayfair (Mr. H. S. well for Messrs. Lakeman, Tucker, & mmell).—Refused.

Uniting of Buildings.

City of London.—Uniting of Nos. 19 and 21, ringdon-avenue, City, by means of an open-, at the basement level (Mr. F. J. Harring-).—Consent.

St. Pancras, South.—Uniting of Nos. 261 and Pentonville-road, St. Pancras (Mr. E. S. for Messrs. Fulford & Sons).—Consent.

St. Pancras, South.—Uniting of No. 261, tonville-road with King's-cross (Metro tan Railway) station (Mr. W. Willox for Metropolitan Railway Company).—Consent.

Cubical Extent and Uniting of Buildings.

Paddington, South. — Mirrors on the oured doors to the emergency communi-on doorways between the blocks of the new ding at the premises of Messrs. W. teley, Ltd., Queen's road, Bayswater ssrs. John Belcher, R.A., and J. J. Joass). fused.

Bayswater. — Rolling shutters in lieu of ndary fire-resisting doors to the lift open- in the block next to Porchester-gardens ssrs. J. Belcher, R.A., and J. J. Joass).—sent.

Construction of Buildings.

City of London.—External walls of a pro-d building to abut upon Lime-street and um-street, City, to be 9 in. in thickness re the ground story, instead of 14 in. in kness (Messrs. Fair & Myer).—Consent.

The recommendation marked † is contrary the views of the Metropolitan Borough ncil concerned.

BUILDING, FURNISHING, AND HOUSE-PLANNING EXHIBITION.

is proposed to hold in Bristol early in an exhibition of the building, furnishing, house-planning trades and interests. The notor is Mr. Charles Howes, Centre-mbers, Bristol, who will be pleased to ish all particulars.

SKELMERSDALE MAIN SEWERAGE.

e Skelmersdale Urban District Council, shire, have instructed Messrs. Taylor & in (Mr. Harry W. Taylor, A.M.Inst.C.E.), wcastle-upon-Tyne and Birmingham, to tigate the existing system of sewers and ge disposal works, and to advise generally the construction of an up-to-date scheme.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Proposed four hostels (20,000*l.*); The Aberdeen Provincial Committee for the Training of Teachers.

Banbury.—Warehouse, West Bar, for the Pytchley Autocar Company.

Berkshire. — Additions, Grazeley County School; Mr. E. Fisher, architect, 19, Buckingham-street, Strand, W.C.

Bradford. — Extensions to Girlington Wesleyan Church (1,000*l.*); The Trustees.

Brynderwen.—School; Mr. C. Best, architect, 3, Bulwark, Brecon.

Burntwood.—Eight houses at asylum; Mr. W. H. Cheadle, Surveyor, County-buildings, Stafford.

Chasetown. — Mining institute; Mr. J. Hutchings, architect, Stafford; Messrs. Mason Brothers, builders, Station-road, Hednesford, Staffs.

Cheltenham.—Additions, workhouse; Mr. T. Malvern, architect, Winchcombe-street, Cheltenham.

Cullompton.—Unitarian Church; Mr. R. M. Challice, architect, Bedford-circus, Exeter.

Darlington.—Theatre; Messrs. Hoskins & Brown, architects, Connisciffe-road, Darlington.

Dennistown.—Block of tenements, Aberfoyle-street; Mr. C. T. McNair, architect, 112, Bath-street, Glasgow.

Derbyshire.—Schools, Long Eaton and Spondon; Mr. G. Widdowes, architect, St. Mary's-gate, Derby.

Dublin.—Premises for the Bank of Ireland, Stephen's-green; Mr. C. H. Ashworth, architect, 11, Northbrook-road, Dublin; Messrs. G. & T. Crampton, builders, Pembroke-road, Dublin.

Dundee.—Offices, Esplanade, for the North British Railway Company. Reconstruction of offices, Hilltown, for Messrs. T. L. Millar & Co. Proposed improvements to laundry at East Poorhouse (1,400*l.*); Surveyor, Parish Council Offices, Dundee.

East Hove.—Cookery and laundry centre at school (1,000*l.*); Mr. S. G. Dancy, Town Hall, Hove.

Elderslie.—Proposed oil engine works for Messrs. Barclay, Curle, & Co., Whiteinch, Glasgow.

Elgin, N.B.—Public baths (3,000*l.*); Mr. A. A. Turriff, Surveyor, Burgh-buildings, Elgin.

Exeter.—Restoration of St. Nicholas Priory (1,000*l.*), also rehousing scheme at St. Thomas; Mr. T. Moulding, Surveyor, Town Hall, Exeter.

Farncombe (Surrey).—Conservative club; Messrs. Gorringe & Sons, builders, Hare-lane, Farncombe.

Farnworth.—Alterations at grammar school; Mr. Thomas Lucas, builder, Rainhill.

Fatfield.—Five houses for the Lambton and Hetton Collieries, Ltd.

Glasgow.—Church hall, Springburn-road; Messrs. H. E. Clifford & Lannau, architects, 225, St. Vincent-street, Glasgow.

Grange.—Parish hall: Mr. H. Fowler, architect, 6, Cornwallis-street, Barrow-in-Furness.

Great Bridge (Tipton).—School; Mr. W. Long, architect, New-road, West Bromwich.

Hawick.—Rebuilding St. George's United Free Church (5,000*l.*); Rev. W. A. P. Johnman, Minister.

Hennock (Devon).—Additions to school; Mr. P. Morris, architect, Richmond-road, Exeter.

Hereford.—Proposed alterations and additions, Brinsop court; Rev. Hubert Delaval Astley, Benham Valence, Newbury.

Hessle.—Cottage homes (2,500*l.*); Clerk to the Sulcoats-gardens, Hessle.

Holmfirth.—Five houses; Mr. W. Hurst, Oak Lees, New Mill, near Holmfirth.

Ilkley.—Additions to King's Hall; Mr. Henry West, architect, Urban District Council Offices, Ilkley.

Ladywood (Birmingham).—Hospital; Mr. F. Martin, architect, Colmore-row, Birmingham.

Liverpool.—Alterations to Seafield House (12,000*l.*); Messrs. W. Hall & Sons, Ltd., 60, Christian-street, Liverpool.

Lossiemouth.—Proposed extensions to cod-liver oil factory for Messrs. Isaac Spencer & Co., Ltd., Aberdeen.

Macclesfield. — Additions to workhouse (6,500*l.*); Messrs. Whittaker & Bradburn, architects, 19, King Edward street, Macclesfield: Messrs. Brown & Co., builders, Wilmslow, Manchester.

Maidstone.—Additions at Kent Ophthalmic Hospital (1,000*l.*); the Governors.

Nantygroes.—School (150 places); Mr. J. W. Nicholas, County-buildings, Carmarthen.

Neithrop.—Forty houses (8,000*l.*); Mr. N. H Dawson, Town Hall, Banbury.

Newport (Mon).—Church (1,780*l.*); Rev. A. A. Matthews, St. James' Parish Church, Newport. Extension, County Hall (6,000*l.*); Mr. H. Tanner, Shire Hall, Newport.

Omagh.—Two hundred houses; Surveyor, Council Offices, Omagh.

Paignton.—Erection of St. Paul's Church; Mr. J. C. Beare, architect, 68, Queen-street, Newton Abbot.

Perry Bar (Birmingham).—School; Mr. J. Hutchings, architect, County-buildings, Stafford.

Poole.—Alterations to Cornelia Hospital; Messrs. A. & F. Wilson, builders, Parkstone.

Rawtenstall.—Thirty-seven houses; Mr. J. Johnson, Town Hall, Rawtenstall.

Renton.—School (5,000*l.*); Cardross School Board.

Renfrew.—Works, Porterfield-road, for the Clyde Rubber Works Company, Ltd.

Retford.—Extension to St. Alban's Church (2,020*l.*); The Vicar, Retford.

Rocklands (Norfolk).—Workhouse infirmary; Mr. H. J. Green, architect, Castle Meadow, Norwich; Mr. R. Shanks, builder, Station-street, Chatteris.

Rye Harbour.—Mission church (1,250*l.*), for the Rev. F. G. R. Wade.

Scarborough. — Roman Catholic Church; Messrs. J. Petch & Son, architects, Valley Bridge, Pandy, Scarborough.

Sheffield.—Enlargement and improvement of Jessop Hospital for Women; the Managers. Additions at Ellesmere-road School (12,530*l.*). and at Whitby-road School (6,854*l.*); Mr. G. S. Baxter, Town Hall, Sheffield.

Shelf.—Additions at Victoria Mills for Messrs. E. Hind & Co., Ltd.

Sherborne.—Twenty-two houses (3,190*l.*); Messrs. Guppy & Son, builders, Bristol road, Sherborne.

Sholing (Hants).—School; Mr. J. Taylor, The Castle, Winchester.

Southampton.—Plans have been passed for rebuilding Kemp's Hotel, Threefield-lane, for Mr. A. A. Burnett, and for nine houses, Oakmount-avenue, for Mr. J. Smith. The latter has also lodged a plan for four houses, Darlington-gardens.

South Cleatham.—Thirteen houses for the Winston Colliery Company.

Stafford.—Nurses' block at asylum (5,800*l.*); Mr. W. H. Cheadle, Surveyor, County buildings, Stafford.

Stalybridge.—Extensions at Bankwood Mills for Messrs. George Cheetham & Sons, Ltd.

Stanley (Yorks).—Erection of St. Peter's Church (8,000*l.*); Mr. W. D. Caröe, architect, Little College-street, S.W.

Wallsend.—Alterations to premises for the Wallsend Industrial Co-operative Society.

Walton-le-Dale.—Weaving shed, Stone Mill, School-lane, for Messrs. T. Eccles, Sons, & Co., Ltd.

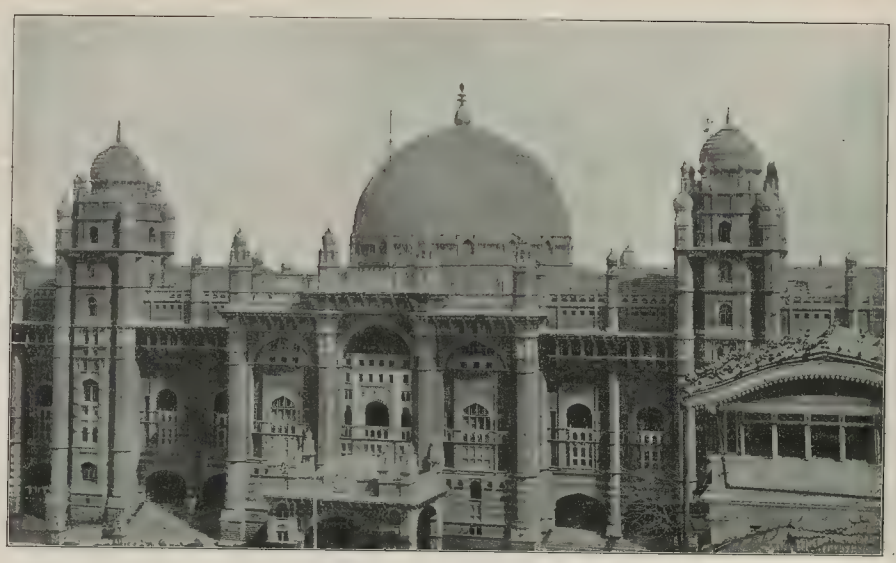
Worcester.—School, St. John's; Mr. T. Graysebrook, architect, 168, High-street, Stourbridge. School, St. George's; Mr. A. Parker, architect, Church House-chambers, Worcester.

Ynysmudw.—Church (3,000*l.*); Mr. J. C. Rees, architect, St. Mary's-chambers, Neath.

York.—Alterations to school (1,750*l.*); Mr. J. H. Mason, Town Hall, York.

* See also our list of Competitions, Contracts, etc., on another page.

WESTMINSTER CITY COUNCIL.



At the fortnightly sitting of this Council on May 23 the following matters were dealt with:—

Tar Spraying.—The Works Committee recommended that thirty-nine streets be tar-sprayed at an estimated cost of 1,000*l.*, the work to be done by Messrs. H. V. Smith & Co., of 20, Victoria-street. The total area to be sprayed is 117,610 super. yds. Agreed.

Subway in Brompton-road.—It was agreed to accede to the application of Harrods, Ltd., to construct a subway under Brompton-road to connect their existing premises with the new premises at 104, Brompton-road. The subway will be 13 ft. wide and 8 ft. high.

Paving Works.—The Works Committee reported on the tenders received for paving and repaving twenty streets. The total of the tenders for the whole of the streets was 23,826*l.* 1s. 7d. It was decided to accept the tenders of the Limmer Asphalte Paving Company, amounting to 738*l.* 16s. 8d.; of Messrs. Griffiths & Co., amounting to 9,240*l.* 6s. 6d.; of the London Asphalte Company, Ltd., amounting to 776*l.* 12s. 2d.; and of the Improved Wood Pavement Company, amounting to 13,070*l.* 7s. 3d.

Argyll-place and Noel-street Improvement.—It was agreed to purchase the freehold of several properties in Argyll-place from Durham University for 23,500*l.*, for the above improvement.

The New General Post Office, Bombay.
Mr. John Begg, F.R.I.B.A., Architect.

NEW GENERAL POST OFFICE, BOMBAY.

THE accompanying illustration shows the central portion of the new General Post Office, Bombay, recently completed from the design by Mr. John Begg, Consulting Architect to the Government of India, and which forms a picturesque feature in the business quarter of Bombay. A prominent feature of this building is the dome, which is rendered waterproof by the use in its construction of Ceresit, supplied by the British Ceresit Waterproofing Company, Ltd.

STAINED GLASS.

A LECTURE on the "Theory and Practice of Stained Glass" was delivered at the Byam Shaw and Vicat Cole School of Art, Campden-street, Kensington, on May 16, by Mr. Leonard Walker, R.B.A. Mr. T. Phillips Figgis, F.R.I.B.A. (who designed the fine school buildings) presided.

The first part of the lecture consisted of an investigation of the state of mind to be cultivated by a designer and worker in stained glass. The latter part consisted of a more detailed description and demonstration of the making of a stained-glass window from the first design to the complete window ready to be erected. In making the design the lecturer insisted on the necessity of the theme and treatment being in harmony with the permanent nature of stained glass; that in the studies from the model for the figures, heads, draperies, etc., one should strive for something more than the particular, more akin to the universal and general, and in harmony with the eternal rather than the particular. An excess of realism in a stained-glass window is not to be sought for, but almost to be preferred to the lifeless conventionality which one gets if one is not continually being vitalised and refreshed by a reference to nature.

In the course of his lecture Mr. Walker said: "I propose to-night to deal with the subject of stained glass from the artistic and workmanlike, rather than the historical and antiquarian, point of view. Not in a retrospective fashion, gazing with wistful eyes at a glorious part gone for ever. We can confidently learn from the world around us, revering the past and studying the works of those who have gone before in so far and only so far as they correspond to the dictates of the highest artistic thought. The things of the artistic spirit transcend time and place limitations. The horizon of art may be extended in a sense, but cannot be superseded.

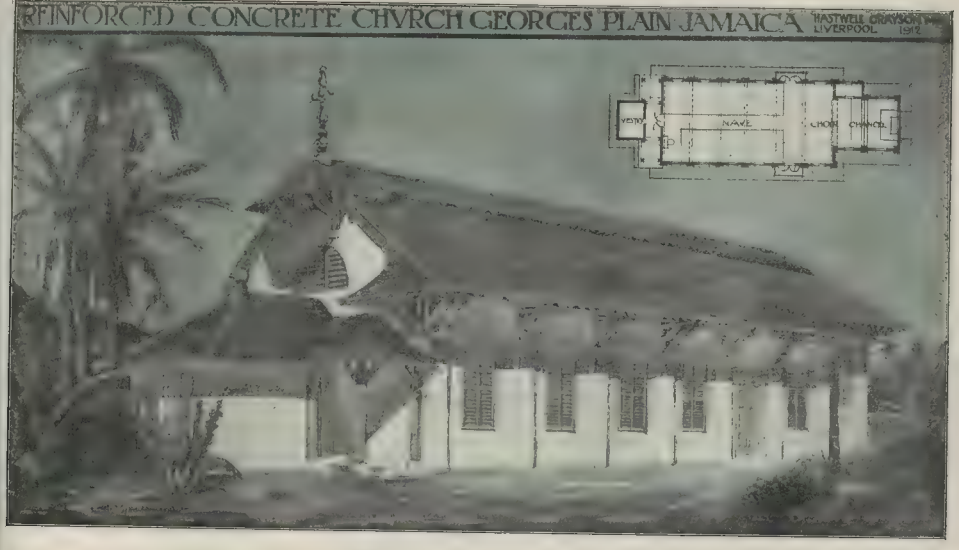
The earliest history of glass is wrapped in mystery, but there seems to be no doubt that glass was used by the ancients in the East in the earliest times to imitate precious stones, for vessels, then for mosaic, and later panes of glass were set in bronze and copper and even in lead, the beginning of our present system. At any rate, not till A.D. 800 did stained glass in the commonly accepted use of the term make its appearance, but little of this glass remains.

From this date some of the finest windows were made. The drawing expressed by the lead-line as far as possible and as it should be. Then when men became very agile at pointing on the glass they got so keen that they converted their windows too much into pictures. Though one cannot entirely withhold one's admiration from the skill shown on stained-glass windows, they fail. At the present day one is glad to say there is a healthy recognition of the limitations of a stained-glass window on the part of individuals working on their own and a few firms.

Now I hinted just now that there is a state of mind to be cultivated by any would-be stained-glass designer based on the limitations of his material. What these limitations are it is difficult to determine exactly, as the work of a great designer seems to transcend restrictions, but, speaking for ourselves, we note that a designer must recognise the relation of a stained-glass window to the surrounding architecture, your window must look as if it grew with the building, not a foreign addition endeavouring to gather all the glory, though complete in itself, yet an integral part of the whole building.

The above remarks need some slight qualification perhaps. I do not advance the view that there should be an absence of individuality in stained-glass windows unnecessarily subservient to the style of the building in manner and treatment, for there is often a resultant charm experienced when one sees buildings witnessing to a variety of thought and custom expressed in its different kinds of windows, memorials, etc. Particular cases of the variety of styles of architecture in one building with happy results will occur to our minds. We can revel in the beauty obtained from the sight of a bed of flowers of one colour and type, restrained order, and also from an herbaceous border, with its infinite variety of colour and species, veiled order under an appearance of freedom.

These thoughts seem to advise, then, a digested appreciation of the style of the building, general lighting, etc., without the artist experiencing a sense of restriction and surrender, but rather a desire to triumph with accepted limitations. And so the designer of a stained-glass window recognises and accepts the shape of the window; he must by handling the glass familiarise himself with its limitations; with practical experience you discover what shapes will stand the kiln without fracture. In a word, he must think in terms of a stained-glass window. Thus a designer, having thought himself into the stained-glass atmosphere, any subject that he chooses can be legitimately carried out. His window will be automatically conditioned within the boundaries of the material. You will heartily welcome the lead-lines. They will express the boundaries of the figures, folds of drapery, etc.



The aspect of your window will control the scheme of balance of light and dark values that you adopt. If much light is wanted to come through the glass, you must not have a heavy rich scheme but a light one, and *vice versâ*. If the stained-glass spirit is upon you you will recognise the flatness of a window; you will not, by an extravagant use of perspective, try to give a "way-over-there" look to portions of your design. No, if we are thinking rightly, light and shade, the diminishing of objects governed by the laws of perspective, etc., may be accepted and all harnessed to legitimately serve you.

There is no reason for weak drawing and an absence of character on your lines; you will carefully compose, then enhancing perhaps by curved lines the uprightness of the stonework, or by similarity echoing the hosts of twists and turns of beautiful tracing. I am only touching on these points in so far as they are particular to stained-glass designing.

Colour with the extension of your palette from white paints to white light provide plenty of excitement; you cannot so much trust to accident as one can sometimes in other branches of art. You must deliberately choose your colours, and you notice that primaries have a tendency to come forward and greys to retire.

We shall then be careful that our design is of such a nature as to allow a strong colour to be near the retiring ones to preserve a kind flatness of effect, an accepted characteristic of the best stained-glass work. Preciousness and jewel-like appearance expressed by the quality of the glass will be carefully considered—in fact, everything that will go to make your work a perpetual joy.

And so briefly I have tried to show what must be the same with all the artistic crafts. Coupled with the vision splendid must be the obedient submission to the conditions and limitations of your material for the production of a work of art."

Church of St. Barnabas, Jamaica.

Mr. Hastwell Grayson, F.R.I.B.A., Architect.

The Chairman, in thanking the lecturer, commended the audience to visit those buildings where beautiful glass may be seen. He instanced the churches in the Strand and city, the cathedrals, and particularly the beautiful windows of Chartres.

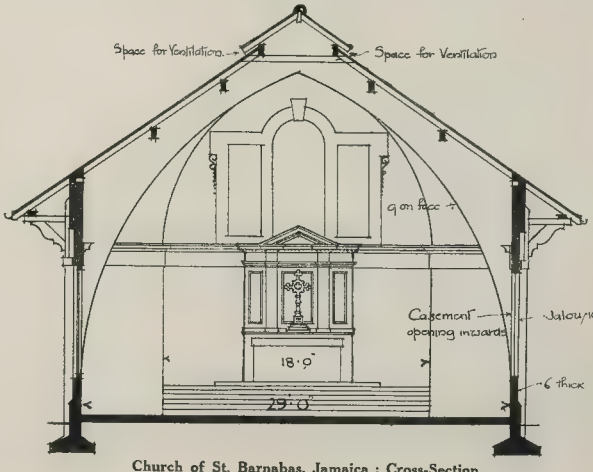
CHURCH OF ST. BARNABAS, JAMAICA.

The site of this church, on George's Plain, just clear of the earthquake and hurricane zones, but so near that it has been felt better to use reinforced concrete for foundations, walls, and principals. The roof itself will be covered with cedar shingles. The church is planned to obtain the maximum cross-ventilation. The whole extent of the nave windows open towards right back against the walls, and the openings are protected by jalousies on the outside. The building is a gift from a lady to the coloured population on her estate. Mr. J. T. Emett is responsible for the reinforced concrete, and Mr. Hastwell Grayson, M.A., F.R.I.B.A., is the architect.

MALTA AS A WINTER RESORT:

SUGGESTED HOTEL.

SIR F. MOWATT, Sir M. D. Chalmers, and Mr. Russell Rea, M.P., the Royal Commissioners appointed in August last to inquire into the economic position, etc., of Malta, have concluded their investigations. In the course of their report they observe: "It appears to us that the attractions of Malta as a winter resort for health and pleasure have not been duly appreciated. The climate in winter is as sunny and more equable than, that of either the Riviera or Algiers. Frost is almost unknown. Valetta is the cleanest, and in situation and architecture one of the most beautiful, of the cities of the Mediterranean. The two great harbours with their branch harbours afford excellent water for rowing and sailing. The old ramparts and fortifications, with the numerous and extensive public gardens, provide clean, picturesque, and attractive promenades. The new system of drainage is complete in the towns, and the water supply is good. There is a handsome opera house, which is open all the winter. The island has the advantage of a large English garrison and is the headquarters of the Mediterranean fleet. English sports, including golf, are available. As a centre from which to visit other places Valetta is convenient. Syracuse may be reached by a daily steamer in eight hours and Tunis in eighteen hours. Both islands are extraordinarily rich in archæological historical, and architectural interest. It appeared to us that, with so many attractions, many of which are not shared by any other of the places of resort for pleasure and health on the coasts of the Mediterranean, it is somewhat singular that Valetta should not possess any large hotel of the first class. We ascertained that the Government are willing to surrender on advantageous terms a site in a central, beautiful, and commanding position. Such a hotel would add to the convenience and attraction of Malta as a place for winter residence, and contribute greatly to the prosperity of the city of Valetta. It is no part of our business to advocate speculations of any kind, but we have made the preceding observations for the consideration of those who are engaged and skilled in such speculations."



LEGAL COLUMN.

Landlord and Tenant: Relief from Forfeiture.

The House of Lords, in the case of Hyman and Another *v.* Rose, have had to consider in what circumstances relief under sect. 14, sub-sect. 2, of the Conveyancing Act, 1881, from forfeiture for breach of covenant in a lease ought to be granted. There has been considerable litigation between the parties, but in both the Court of Appeal and the House of Lords the point to be decided was simply whether relief from forfeiture should or should not be granted.

In 1845 a lease of a piece of land was granted for ninety-nine years, less ten days, for the erection of a chapel. The lease contained covenants that the chapel should well and substantially be repaired and maintained, and that the front elevation of the buildings should not be varied or altered without the consent in writing of the lessor; certain trades were prohibited to be carried on on the premises, and there was a power of re-entry in case of breach of covenant. The chapel became unused and fell into disrepair, and in 1910 the lease became vested in Hyman and another, the Charity Commissioners having authorised the sale of the lease, and they proceeded to adapt the premises for use as a cinematograph theatre. Mrs. Rose, the reversioner of the lease, applied for damages for injury to the reversion, an injunction, and possession of the premises.

The defendants, in converting the chapel into

Church of St. Barnabas, Jamaica: Cross-Section.

a theatre, had put it into repair, but they had made some alterations in the building. The main alterations were the opening of a door in the west side wall, the removal of railings on two sides and a dwarf wall, thus throwing strips of ground into the streets, the removal of the gallery staircases, and the substitution of others. The Master of the Rolls considered that waste had been committed as well as a breach of the covenant to repair, and Lord Justice Fletcher Moulton held there was breach of covenant to repair, and as there was no undertaking that the breach would not be continued the Court declined to grant relief. Lord Justice Buckley dissented, and the House of Lords agreed with his dissenting judgment.

The Lord Chancellor, referring to various rules which had been laid down by the Master of the Rolls, upon which the discretion for granting relief might be grounded, intimated that they should not be taken as rigid rules, but the discretion of the Courts conferred by the statute should be left unfettered.

In the lease under consideration it was competent for the lessees to discontinue the use of the building as a chapel and to use it for any purpose not prohibited, of which the use of the building as a theatre was not one, and the rearrangement of the internal portion of the building was therefore legitimate. The opening of the door was also held to be neither waste nor a breach of covenant. Only an alteration of the front elevation was expressly prohibited. The removal of the railings and dwarf wall was held not to constitute a breach of covenant, because it was not in existence at the time of the demise, nor was it waste, because the lessees had undertaken to prevent a dedication to the public of the land hitherto enclosed by from time to time erecting movable railings.

Thus it appears that the grounds upon which relief was granted in this case were:—(1) That there had been no breach of covenant at all by the three lessees; (2) nor was there waste. The character of the premises demised had not been altered, nor had the value of the reversion been injured; on the contray, the value had been enhanced.

It should be noted, however, that the lessees had offered to deposit a reasonable sum of money to ensure the entire restoration of the premises to their former condition as a chapel, which offer exceeded such terms as the Court thought necessary to prescribe. The terms prescribed by the House of Lord were that the ground lying within the former fence should be paved to distinguish it from the footpath, that a movable fence should be erected from time to time, and that the building should be repaired consistently with the notice to repair served on the vendor.

Party Walls: London Building Act.

The case of Minturn *v.* Barry, noted by us July 21, 1911, and reported on appeal in our columns last week (May 24), is not a favourable example of speedy or certain litigation. The question involved in the case was whether a party wall was "defective or out of repair" within the meaning of sect. 88, sub-sect. (1) of the London Building Act, so as to enable the plaintiff to avail herself of the procedure provided by the Act. The wall was damp, and it was proposed to open the foundations, and if there was no damp-proof course, to insert a horizontal damp-proof course; also to build a vertical damp proof course on the defendant's side of the wall, to repaint the brickwork, and to construct a weather joint on the defendant's side.

The surveyors appointed under sect. 91 held that the wall was not so defective as to come within the sub-section; the County Court Judge held that the plaintiff's claim amounted to rebuilding the premises with modern improvements, and that this exceeded what was contemplated by the section, "making good and repairing." The Divisional Court sent the case back to the County Court Judge. The Judges appear to have found that the surveyors came to the conclusion that the wall was not out of repair, because it could bear the weight imposed upon it, and that the County Court Judge had not considered whether damp could make a wall defective within the meaning of the section.

The case was retried in the County Court, and on this second trial the Judge went into the history of the wall, and found that on the plaintiff's side the party wall was originally but a garden wall, and this being so, that the plaintiff could not go on the building owner's side and remedy a defect arising from the conversion of a garden wall into a party wall. The Divisional Court was again appealed to and approved this decision. Now the case has come before the Court of Appeal, and the Court of Appeal have held that there must be a new trial, as the County Court Judge had no right to inquire into the history of the party wall, but was only to consider it as an existing structure. Thus there have been six judicial inquiries, including that of the surveyors, and the case has yet to be decided, and all that can be said upon the law is that the Divisional Court on the first appeal intimated that dampness might suffice to make the wall "defective and out of repair" within the meaning of the section.

London Drainage By-laws.

In our issue for March 8 we commented upon a decision of a Police Magistrate in the case Marylebone Borough Council *v.* White, venturing to suggest that the decision could not be supported. The case has now been carried to the Divisional Court, and that Court has considered the by-law in question in the manner we suggested. The by-law which it was contended in the case had been infringed was By-law 11 of the Drainage By-laws of the London County Council, made under the Metropolis Management Act, 1855, and dated June 14, 1901. It provides "that any person who shall provide a soil pipe in connexion with a new building for the purpose of conveying to a sewer any solid or liquid excremental filth or shall for that purpose construct a soil pipe in connexion with an existing building, shall, whenever practicable, cause such soil pipe to be situated outside such building and shall construct such soil pipe in drawn lead or of heavy cast-iron. Provided, that in any case where it shall be necessary to construct such soil-pipe within such building he shall construct such soil pipe in drawn lead. . . ."

On the premises in question there was a soil pipe running down the back main wall of the building. At the first-floor level, there being an extension of the building with a flat roof, the pipe entered the building, being caried down to the basement level inside. During its whole length it was of iron. The Magistrate held that the by-law applied only to pipes wholly inside or wholly outside the building; but the Divisional Court reversed this decision. As we pointed out before, the by-laws appear perfectly clear, and By-law 12 provides for connexions between lead soil pipes and iron pipes. Structural considerations may apply to render it necessary to construct a soil pipe within the building, and the by-law (No. 11) recognises this necessity, but insists on the pipe within the building being of drawn lead.

Landlord *v.* Tenant.

In an underlease granted to the plaintiffs in the case Premier Rinks, Ltd., *v.* Amalgamated Cinematograph Theatres, Ltd., there were covenants by the plaintiffs not to assign, underlet, or part with the possession of the premises without consent, "such consent not to be unreasonably or vexatiously withheld in the case of a respectable assignee, underlessee, or tenant," and not to carry on any dangerous, noxious, noisy, or noisome, or offensive trade or business. The reversion of the underlease was vested in the defendants. A receiver had been appointed of the plaintiffs' undertaking, and the premises were to be sold, so application was made to the defendants for consent. The defendants raised no objection to the respectability of the assignee, but as they were carrying on a cinematograph theatre in the adjoining premises they endeavoured to make it a condition that no such exhibition should be carried on in the premises to be assigned, and submitted a licence in this form to be construed as though it had been originally inserted in the underlease. A number of cases were cited to the Court, but, according to the report of the case in the "Weekly Notes," the Court considered that the sole question to be decided was whether the refusal was reasonable or not; and it was held unreasonable, for the defendants were making the assignment conditional upon an entirely new condition being engrafted on to the lease. Other cases on this question will be found noted the *Builder*, July 11, 1903: March 26, 1910: and May 10, 1911.

Workmen's Compensation.

The case of Ball *v.* William Hunt, which we noted the *Builder*, April 7, 1911, and again referred to April 26 last, has been carried to the House of Lords. The case is a very curious one. A man employed as an edge tool moulder some seventeen years ago had lost the sight of one eye in an accident, but he was able to continue his employment at the old rate of wages. In September, 1910, he met with another accident, which set up inflammation in the blind eye, and in consequence the eye had to be removed. The defect in his sight had before that not been obvious, but now, of course, it became apparent; but in other respects the man's earning capacity after he had recovered from the operation remained the same. He was paid compensation until he had recovered, and the majority of the Court of Appeal in these circumstances held he was not entitled to further compensation. The House of Lords have reversed this judgment, holding that "incapacity for work," the words used in Schedule I., par. 1, of the Act, include not only incapacity to do work, but inability to get work provided that inability is due to injury by accident and not to the conditions of the labour market. It must be confessed that this decision only increases the difficulty of interpreting the statute, and will leave employers and insurers in greater doubt than ever as to their liabilities. In the case Hargreaves *v.* Haughhead Coal Company, Ltd. (the *Builder*, April 26 last) the House of Lords held that the loss of an eye did not entitle a man who was able to obtain work at the same wages to have a nominal award made so as to keep his claim to compensation open. The present case is hard to reconcile with that decision, as the one-eyed man is always apt to find difficulty in obtaining work, and if he has obtained it once there is no reason to believe that he will retain it, yet the interval of employment, according to the decision in Hargreaves' case, would lose him any right to compensation. Lord Shaw recognised one difficulty which would follow on the decision now given, which is, that depressed conditions of labour affect mutilated men more than sound men, and there may be considerable difficulty in determining which is the cause of unemployment, the depression in the labour market or the mutilation. Lastly, if a man's capacity to do work is no longer to be the test applied, but his capacity to get work is to be regarded, most extraordinary results will ensue. For instance, it is well known that middle-aged clerks cannot get employment, and that they have to dye their hair to appear younger. If a clerk meets with an accident and his hair in consequence goes grey, and he can no longer get employment, his case is exactly similar to the man in this case—his earning capacity remains unchanged, but his chances of obtaining work are diminished through the accident, and, according to this decision, followed to its logical conclusion, he is entitled to compensation as for "personal injury by accident," the words used in sect. 1 in respect of his hair changing colour. The determination of physical incapacity has proved an extremely difficult task under the Act, but it will become even more complicated now that the House of Lords have held that physical appearance has to be taken into account. We recently pointed out that a one-eyed man is in a worse position under the Act than a one-armed man, and possibly the Legislature may see fit to amend the Act in view of the above decisions, so that the one-eyed man may obtain a nominal award to keep his claim alive in case real physical disability supervenes as a consequence or a partial consequence of the loss of one eye, for, as we observed in our article, April 26, if the man loses the sight of his remaining eye, his total incapacity is due in part to the original accident.

In another case on appeal from the Scotch Court of Sessions (Macdonald or Duris *v.* Wilson's and Clyde Coal Company) the House of Lords had to consider the case of an injured workman. The man in that case was capable of doing certain light work which his employers gave him, in addition to a payment of compensation. After eighteen months they ceased so to employ him, and he applied for a review of the compensation. The Scotch Courts held there was no ground for a review, but the House of Lords remitted the case to the Sheriff.

The man alleged that his employers, although he continued fit to do the same light work, had declined longer to give it him, and he was unable to obtain work in the district. The House, in remitting the case, observed that it was for the arbitrator to determine what steps a man could be asked to take in order to obtain employment, and this involved a fact often difficult of determination: but the Lord Chancellor intimated that it must be understood that work could not be obtained at a place within reasonable access. On this question we may refer to our article of June 2, 1911, where some of the cases are considered. When a man is only fit after an accident for very special light work, in most cases it is the employers who seek for a review with a view to reducing the full compensation, and then the onus lies upon them of proving the man's capacity. In this case the man was applying for a review, but presumably if he showed that light work was impossible to him, the onus of proving the contrary would be shifted to his employers. In both the above cases, however, the House of Lords appear to not limit the question to capacity for work, but to extend it to ability to obtain work. This is a serious question for employers and insurers.

LAW REPORTS.

CHANCERY DIVISION.

(Before Mr. Justice SWINFEN EADY.)

illis and Others *v.* Biddulph and Others :

Ancient Lights and Crown Leases.

HIS was a motion by the plaintiffs to rain the defendants from erecting any ding on land adjoining the plaintiffs' mises in Pall Mall in such a manner as njure the plaintiffs' lights.

r. Micklem, K.C., said the plaintiffs held Pall Mall under a Crown lease, granted 1823, and the premises were used as a ure gallery and known as the French eries. The gallery was lighted by a ern light, which ran along its whole length, t. 10 in., and the interference complained was caused by the proposal of the de- ants to carry up a wall 16 ft. away, 38 ft. re the sill of the window, much higher it was before. The defendants had ght reversions of the Crown leases of Nos. and 119, Pall Mall, which they had ndered to the Crown, and they were now ding under a building lease, and alleged their plans had been approved by the rn. Counsel contended that such approval d not affect the plaintiffs' rights.

s Lordship said the fact that the de- ants held under a Crown lease did not ar to affect the question.

r. Micklem said that another wall was posed to be carried to a height of 49 ft. e the sill.

r. Macnaghten, K.C., for the defendants are trustees of a club), said his clients always been prepared to meet the tiffs in any way, apart from altering plans.

fter his Lordship had been taken through plans by Mr. Micklem, K.C., Mr. Mac- ten, K.C., submitted that, having regard he defendants' position as tenants of the n, they could not be restrained, and ter, there was no sufficient obstruction of to justify an injunction.

s Lordship said that if the parties were to try at once without pleadings he d make no order on the motion, except the costs be costs in the action. The s could apply to expedite the hearing, he would do his best to try the case very next sittings.

OFFICIAL REFEREE'S COURT.

(Before Mr. MUIR MACKENZIE.)

Claim against a Building Owner :

Dawnay *v.* Mulholland.

ERVED judgment was delivered in this ast week. The plaintiffs, Messrs. Archi- D. Dawnay & Sons, Ltd., engineers, of rsea, claimed 2,301*l.* 19s. 10d., balance of ount due from the defendant, Mr. J. B. lland, for steel constructional work ed at Wimbledon Theatre, of which Mr. lland is the owner. The plaintiffs had ed the defendant with 1,000*l.* odd paid ount to them in September, 1910. Mr. lland admitted the claim, but pleaded he work which the plaintiffs contracted should have been completed by June 30, ut that it was not finished by then, and nder the contract between the parties s entitled to 25*l.* a day as penalty for lay. Mr. Mulholland, urging that he have unliquidated damages, claimed that d been prevented from producing plays autumn season, and that he had suffered wing to the delay. He had also con- . that his Christmas pantomime of 1910 en prejudiced by the same cause.

plaintiffs, on the other hand, disclaimed sponsibility for delay—if any—and said had not been furnished with adequate out plans, and that they had, in mak- signs, to comply with alterations, sent rvals, on behalf of Mr. Mulholland. ffs declared they had proceeded with rk with all possible despatch.

Randolph and Mr. Herman Cohen (in- d by Messrs. Amery, Parkes, & Co.) red for the plaintiffs; and Mr. M. ker and Mr. Bodoano (instructed by Mr. ey Sharp) represented the building

Bertie Crewe, an architect specialising atre work, was amongst the many es called on behalf of the plaintiffs. contentions he upheld. He declared in rse of his evidence that it was usual steelwork engineers a full set of plans he tiers to begin with. They invariably d the longitudinal sections. These were, he said, the most essential plans. Steel constructional engineers could not set about their work properly without correct plans.

Mr. Mulholland, in the witness-box, when examined by Mr. Drucquer, stated that to the plaintiffs' representatives he had, from the outset, emphasised upon them the importance of time. He alleged that the plaintiffs gave him no indications that there would be delay over which they had no control.

Answering Mr. Randolph, the defendant said he did not regard the architect, whom he engaged as his "creature." He thought, however, that an architect should act in conjunction with the building owner, and his architect had had to do that.

Mr. Randolph was proceeding with a further question in that connexion, when Mr. Muir Mackenzie said that the architect was in a certain measure agent for the building owner. Under certain matters he had to act impartially between the building owner and the builders.

Mr. Randolph asked Mr. Mulholland if it were his suggestion that plaintiffs had deliberately acted in order to make more out of the contract.

Mr. Mulholland: I should not like to say that. I consider they were simplifying and economising.

Mr. Randolph: Trying to do the best they could?—Put it like that if you like, but not for me.

Mr. Randolph: I say they were trying to do the best they could in your interests. Throughout, the plaintiffs are objecting to be saddled with the delay. You said: "You are delaying," and they said: "The delay is not ours, and you cannot complain. You cannot impose penalties."

Witness: In some of their letters they apologise for their delay.

Subsequently, however, Mr. Mulholland admitted that the plaintiffs repudiated responsibility.

Mr. Cecil Albury Masey, an architect, said that for some years he was chief assistant to Mr. Bertie Crewe, and when with that gentleman witness undertook sole responsibility in connexion with the carrying out of plans for numerous theatres. In March, 1910, witness was engaged to help in connexion with the Wimbledon Theatre project. He thought that plaintiffs had been provided with adequate plans and data. Plaintiffs had not complained to him verbally of the absence of complete plans, but witness, on the other hand, had had to complain to Messrs. Dawnay of the slow way details were coming in.

In answer to the Official Referee, the witness said that in letters he had written to the plaintiffs during the progress of the work he had not reminded them that they were incurring penalties of 25*l.* a day. It had not occurred to him to do so.

The Official Referee expressed the opinion that it was possible that if plaintiffs knew they were incurring penalties of 25*l.* a day, or 175*l.* a week, they might, perhaps, not have regarded the contract as an over-profitable one.

Mr. Robert Briggs, partner in the firm of Messrs. Frank Matcham & Co., architects, who have designed over 150 theatres, said he regarded the plans prepared by Mr. Masey as sufficient to enable Messrs. Dawnay to prepare their details of their own scheme. The roof at the outset was the only weak part, but he had seen pencilled additions.

Mr. Drucquer: What is the best order of erecting this steelwork in a theatre?—From an architect's point of view, the proper way to put the steelwork up is to follow the building up. Put the ironwork in as you go up. Engineers prefer that they should fix their roof, then their gallery, and then their circle. It is easier for them.

Mr. Henry, another architect, having given evidence on behalf of the defendant's case,

Following the evidence and arguments during a protracted hearing, Mr. Muir Mackenzie reserved judgment on May 13, and delivered it on May 23. After an exhaustive review of the parties' respective contentions, Mr. Muir Mackenzie said he thought he would be doing his duty if he adopted what Mr. Bertie Crewe had said in the course of his evidence, to the effect that he considered there had been some delay, and that the iron and steel work should have been completed about three weeks earlier than it was completed. In the circumstances he decided to award defendant 300*l.* for unliquidated damages on the counterclaim. There would be judgment for the plaintiffs on the claim for 2,301*l.* 19s. 10d., and judgment for the defendant on the counterclaim for 300*l.* He thought the counterclaim was very much exaggerated, and, to a great extent, had failed, and accordingly defendant would be awarded only one-third of the costs of the counterclaim. Plaintiffs would have the whole of the costs of the action.

OFFICIAL REFEREE'S COURT.

(Before Mr. H. W. VEREY.)

Clinch *v.* Jackson :

Referee on Time-Sheets.

A CONSIDERED judgment was given by Mr. Verey, after a hearing lasting several days, in an action brought by the plaintiff, Mr. William Clinch, trading solely as Messrs. A. Clinch & Son, and carrying on business as a builder and decorator at 8, Halliford-street, Canonbury, against the defendant, Mr. Lewis Jackson, of Glenhaven, Gloucester-gate. The plaintiff sought to recover 416*l.* 16s. 11d. for decorative and other work executed at a house in Ashley-road, Hornsey Rise, which defendant had purchased. Mr. Jackson had paid 175*l.* to the plaintiff, and 75*l.* into Court, which he contended was sufficient to satisfy the plaintiff's claim.

Mr. Verey, in delivering judgment, said that the defendant did not dispute that he engaged the plaintiff to do the work, and had expressed his willingness to pay fair value for work done. Dealing with the various questions which he (the Official Referee) had to decide, he said that first of all he found that plaintiff did agree to give defendant full trade discounts on all materials, as alleged by the defence. Dealing with the question as to what was a fair and reasonable value for the work done, Mr. Verey said that plaintiff rested his case on time and materials. Time-sheets deserved full consideration, but where work could not be seen and measured an employer was not necessarily to be bound strictly by the time-sheets. Three surveyors had been called for the plaintiff, but none of them, said the Referee, remained on the premises for much more than an hour, and they took no measurements. On the other hand, two surveyors had, on behalf of the defendant, inspected, together with a builder, the work over a period of two days. Furnished with items of expenditure, they had examined every detail and measured up the work, allowing 15 per cent. profit to the plaintiff. Those witnesses were men of experience, and evidently thoroughly acquainted with details of such work; they had given their evidence fairly, and had been unshaken in cross-examination. In his (the Referee's) opinion, 15 per cent. was a fair profit for plaintiff's work. On the whole facts, he had come to the conclusion that the plaintiff had failed to prove his claim, both as to labour and materials, and that 250*l.* was full value for work done and materials supplied, and that the 75*l.* paid into Court by defendant, together with 175*l.* paid before the action, was sufficient to satisfy plaintiff's claim. Judgment would, accordingly, be given for the defendant with costs.

DIVISIONAL COURT.

(Before the LORD CHIEF JUSTICE and Justices PICKFORD and AVORY.)

Case under the Metropolis Management Acts :

Marylebone Borough Council *v.* White.

THIS case was heard on the 23rd inst. upon the appeal of the Marylebone Borough Council from a decision of the Stipendiary sitting at the Marylebone Police-court.

The facts came before the Court in the form of a special case stated by the Stipendiary, from which it appeared that the respondent, Sir Edward White, was the owner of No. 21, Upper Berkeley-street, W., who in January, 1912, was making certain alterations and additions to the drainage system and sanitary appliances at his premises, which work first came to the notice of the Council's Sanitary Inspector on January 3. Respondent had given the appellants no notice of his intention to carry out such works, nor had he deposited with them plans, etc., as required under the London County Council by-laws made under the Metropolis Management Act, 1855, sect. 202, and the Metropolis Management (Amendment) Act, 1899. When the Sanitary Inspector inspected the works he found that the respondent had constructed at the premises a soil pipe, which extended for some distance above the top of the back main wall, vertically to the basement level, with which communicated water-closets at the second and first floor levels. At the first-floor level the soil pipe entered the interior of the premises, there being built out from the back main wall a two-storied back addition with a flat roof. On the ground-floor level, at the rear of the back addition, there was a third water-closet, from which a soil pipe went inside the premises vertically downwards to the basement level, then passed along the basement level towards the front of the premises, and joined the lower end of the soil pipe. On January 3 the Medical Officer wrote to the respondent, pointing out that proper notice had not been given of the work, nor had

plans been deposited, and stating that much of the work done was not in accordance with the by laws. Respondent afterwards deposited with the Council certain plans, and on January 16 the Medical Officer wrote again to the respondent, stating that the soil pipes inside the building were not of lead, as required by the by-laws of the London County Council, and that therefore the plans could not be passed. On January 18 the respondent wrote to the Medical Officer, stating that he did not intend to alter the iron soil pipes, so he would have to be content to let them remain without his approval. On February 7 the Medical Officer wrote that the plans had been considered by the Public Health Committee of the Council, and that as the soil pipe was not in accordance with the by-laws, the portion inside the premises being of iron instead of drawn lead, the Committee could not grant approval.

It appeared that the soil pipe was 50 ft. long from its commencement down to the basement level, of which about 30 ft. from the top to the first-floor level was outside the premises, and about 20 ft. within the premises. It also appeared that the whole length of the soil pipe was of iron piping and not of drawn lead, with proper wiped plumber's joints where it had been constructed inside the building.

Upon these facts the Council laid an information against the respondent that he did unlawfully construct within his premises soil pipes of iron instead of in drawn lead, with proper wiped plumber's joints, as required by By-law 11 of the Drainage By-laws of the London County Council.

The magistrate held, however, that as the pipes were half inside and half outside the premises, the by-law was not applicable, and that unless a pipe was wholly inside or wholly outside the premises the by-law did not apply From this decision the Council now appealed.

At the conclusion of the arguments, their Lordships held that the object of the by-law was that inside a building the pipe must be of lead with proper joints, and that, therefore, the by-law did apply to the facts in the case. They therefore remitted the case to the magistrate.

Mr. Patrick Hastings appeared for the appellants, and Mr. Wild for the respondent.

LONDON COUNCILS.

Acton.—At the last meeting of the Urban District Council, plans submitted by the Surveyor were approved for paving with tar macadam the carriageways of Churchfield-road, East Acton lane, Alfred-road, Rosemont-road, and portions of South-parade, Valetta-road, and Southfield-road; also for paving with artificial stone the footways of The Avenue, Alfred-road, Burlington-gardens, and Essex-road. The total estimated cost is put at 2,400*l.*, and tenders are to be invited for carrying out the work.

Barnet. The second portion of Bedford-avenue is to be made up. At a recent meeting of the Isolation Hospital Committee it was decided to apply to the County Council for permission to borrow 4,000*l.* for extensions to the hospital.

Battersea.—The carriageway of Clapham-common-road is to be made-up with tarred slag macadam at an estimated cost of 2,190*l.* Other works are to be carried out in connexion with this, including the provision of new 12-in. by 18-in. kerbing, at an estimated cost of 2,324*l.*

Bermondsey.—Plans have been passed for Mr. J. M. Kennard, architect, 13, Railway-approach, London Bridge, S.E., on behalf of Mr. W. J. Hall, for the erection of buildings in St. Helena-road.

Camberwell.—The Council have decided to carry out, on behalf of the London County Council, paving works, etc., in connexion with the widening of a portion of Camberwell New-road The cost is put at 240*l.*, excluding pipe alterations. In consequence of Messrs. E. & E. Iles withdrawing their tender for carrying out kerbing, channelling, foundations, and roadwork, etc., in part of Redpost-hill, fresh tenders are to be obtained.

Croydon.—At the last meeting of the County Council a memorial was received for the immediate enlargement of the South Norwood Baths. This was referred to the Sanitary Committee. Electricity mains are to be extended at an estimated cost of 1,945*l.* The following plans have been passed:—Mr. W. Booth, 101, Queen Victoria-street, E.C., Salvation Army Hall, Brighton-road; Messrs. Higgins & Thomerson, 37, Finsbury-pavement, E.C., six houses, Macclesfield-road; Mr. E. A. Tyler, Ealing, W., three houses and shops, Brigstock-road: Messrs. Smith & Sons, 202, London-road, hall, Thornton-road, and two houses, Pollard's-hill West; London Co: and Westminster Bank, Ltd., bank and house, London-road, Norbury; Mr. J. Cooper, 101, Cherry Orchard-road, fifteen houses, Kilmartin-avenue; Messrs. Paish, Tyler, & Co., 6, Station-road, West Croydon, four houses, Fryston-avenue; Mr. J. B. Gunn, West Kensington, S.W., four houses, Shirley-road.

Finchley.—The following plans have been passed:—Mr. J. T. Cherry, four houses, Friern Barnet-lane; Mr. J. Watts, four houses, Rosemary-avenue; Mr. E. Brown, motor garage, Oaklands, Woodside Grange-road. Plans have been lodged by the Co-Partnerships Tenants, Ltd., for twenty houses off Regent's Park-road; also by Mr. Robert Turner's executors, for three roads and sewers on Willow Lodge Estate.

Greenwich.—Vanbrugh-fields is to be formed and paved as a new street. Tenders are to be invited for forming and paving Kidbrooke-gardens.

Hackney.—Portion of Wattisfield-road is to be made up as a new street. In connexion with the reconstruction and electrification of the tramways in Dalston-lane and Graham-road, the Borough Council has decided to intimate to the London County Council, at whose expense the paving will be laid, that they prefer that the breasts of the carriageways (which are to be afterwards maintained by the Borough Council) to be paved with Acme sectional jarrah wood-blocks, 3 in. deep, subject to the condition that the Acme Flooring and Paving Company (1904), Ltd. (the sub-contractors for the work), shall first enter into an undertaking with the Borough Council that they will maintain the paving in good condition to the satisfaction of the Borough Engineer and Surveyor, and free of all expense to the Council, for a period of seven years from the date at which the work is completed. The Works Committee have decided to provide an above-ground châlet in Victoria Park at an estimated cost of 700*l.* The work of kerbing, paving, etc., to improve the entrance to the Park, is to be carried out at an estimated cost of 775*l.* Messrs. Gordon & Gunton, F.R.I.B.A., Finsbury House, Blomfield-street, E.C., have been appointed architects to act with the Borough Electrical Engineer for the erection of the necessary buildings included in the scheme for the extension of the electricity undertaking. The following plans have been passed:—Messrs. J. Garey & Sons, on behalf of Messrs. F. W. Glover & Son, building, Lower Clapton-road; Mr. J. Tennant, factory, Hertford-road; Messrs. Sheffield Brothers, factory, rear of No. 3, Downs Park-road: Messrs. G. Wilson & Co., buildings, rear No. 130. Lansdowne-road.

Hendon (Urban).—Sanctions have been received from the Local Government to the borrowing of 11,642*l.* for street improvement works in Golder's Green-road: 17,053*l.* for the proposed garden suburb schools and 695*l.* for the equipment and furniture. The Surveyor has been instructed to prepare plans and estimates for making-up portion of Colindale-avenue; the footpaths are to be paved with artificial stone. The tender of Messrs. H. Elliott & Co., Ealing, has been accepted at 806*l.* for carrying out sewerage and surface-water drainage work in Green-lane. The following plans have been passed:—Mr. F. W. Troup, additions to Spalding Hall, Victoria-road; Messrs. Harvey & Potter, dairy, etc., Finchley-road; Messrs. Haymills, Ltd., motor garage, Golder's Green-road; Mr. T. G. Golby, six houses, Limes-avenue, Mill Hill: Mr. W. J. King, four houses, Park drive and The Park, Golder's Green; Metropolitan Electric Tramways Company, omnibus garage, Edgware-road, The Hyde. The following have been lodged:—Mr. S. W. Bristowe, six houses, The Drive, Golder's-green; the Ecclesiastical Commissioners, new road, near Cricklewood-lane: Mr. J. D. Rawlings, six houses, St. George's-road; Mr. T. Dinwiddy, ten shops, Hale-lane, Mill Hill; Mr. J. Gibb, six shops, Lawrence-street, Mill Hill; Hampstead Heath Extension Tenants, four houses, Hampstead-way; Messrs. Hamiltons, seventy-eight houses, Neald-crescent and Queen's-crescent.

Islington.—Electricity mains are to be extended at an estimated cost of 333*l.*

Kensington.—Siphon trapped pan gullies are to be substituted for the existing obsolete type in eight roads, at an estimated cost of 324*l.* The tenders of the Improved Wood Pavement Company, Ltd., have been accepted as follows:—Laying new wood-paving: portion of Clarendon-road, 9s. 10½d. per super. yard; portion of Ovington-square, 9s. 3½d. per super. yard: portion of Thurloe-place, 11s. 9d. per super. yard; renewing wood-paving: portions of Kensington High-street and Kensington-road, 7s. 6d. per super. yard; Sydney-place and Onslow-square, 6s. 3½d. per super. yard: portion of Gloucester-road, 6s. 10½d. per super. yard; portion of Richmond-road, 7s. 5½d. per super. yard; portion of Ladbroke-grov 6s. 10½d. per super. yard.

Lambeth.—Portions of the carriageways Waterloo-road, York-road, and Stamford-stre are to be repaved with Swedish paving bloc at an estimated cost of 315*l.* Plans have be lodged with the London County Council, Mr. Walter Cave, for the erection of a buil ing at the corner of Exton-street and Secke street.

Lewisham.—Plans prepared by the Borou Surveyor have been approved for paving a forming Thomas-lane. The cost is put at 44 The Improved Wood Pavement Compan Ltd., are to be offered the wood-paving wo along the route of the new tramways fro Rushey-green to Forest-hill, at the prices out in their contract, which was accepted f paving Catford-bridge. Artificial stone is be laid in lieu of the existing tar-paving portions of nine roads, at an estimated cost 254*l.* Repair works are to be carried out St. Mildred's-road at an estimated cost 178*l.* Plans have been lodged by Messrs. J. Heath & Sons for the erection of six houses Arthurdon-street; also for Messrs. F. & Abbiss for fifteen houses in Bartram-road a six houses in Brockley-road.

Shoreditch.—In connexion with the propos of the Council to repave Shrubland-road, estimate of the Northern Quarries Company lay a 4-in. bed of Quarrite paving, with waterproof surface of strong bitumen, stre with granite chippings, upon foundations be prepared by the Council, at 4s. 2d. square yard, has been accepted, the work be guaranteed for a period of twelve months.

Surbiton.—Tenders are to be invited carrying out the work of making-up Malve road. The carriageway is to be done with macadam on hardcore foundations, with paving for the footpaths.

Tottenham.—Tenders are to be invited straightening and culverting the Stonebrid Brook, South Tottenham. The following pl have been passed:—Messrs. Whitbread & C additions at the Bell Brewery, 676, Hi road; Mr. H. Lebus, re-erection of wood w shed, Ferry-lane; Mr. W. Brown, the Ea public-house, Tottenham; alterations, etc., Black Boy public-house, West Green-ros Messrs. Millington & Sons, extensions to factory, Crown Works, Fountayne-road; A. Dixon, additions at Oakdale Arms, Herr tage-road; Mr. S. E. Child, twenty-th houses, Gladesmore-road; Messrs. Tucker Sons, Ltd., timber stores, Lawrence-road. following have lodged plans:—Mr. H. Couchman, shop and warehouse, Bruce-grov Messrs. James A. Jacobs, Ltd., factory, ne Tariff-road; Messrs. Hale & Co., gara Queen's Head public-house, Green-lanes.

Walthamstow.—Sanction has been receiv from the Local Government Board to borrowing of 217*l.* for making-up Evesh avenue. Plans have been passed for Mes H. Slow & Son for the executors of late J. Hitchman, for the erection of four houses Forest View-road. Plans have been lod by Mr. J. E. Ashby for the erection of foundry, etc., in Blackhorse-lane; also by F. G. Faunch, on behalf of the Trustees Commercial-street Trust, for the erection a chapel and Sunday-school in Church-hill.

Wandsworth.—The following tenders h been accepted:—Messrs. J. Mowlem & Ltd., paving part of Cowick-road, Toot (footpaths with Aberdeen adamant), 625*l.*; Thomas Adams, repairing part of C borough-road, Streatham, 264*l.*; Messrs. Woodham & Sons, repairs to part of Prince road, Southfield, 787*l.* Plans have passed for Messrs. Holloway Brothers (Londo Ltd., for the erection of a motor garage, alterations and additions to Sylva, Putn Heath; also for Mr. J. J. Taylor, for fourte houses in Oakmead-road, Balham.

Watford (Rural).—Plans have been pas for Messrs. Clutterbuck & Co., of Chorleywo for additions to the Old Red Lion pub house, Grove-place, Aldenham; also for Rickmansworth and Uxbridge Water Co pany, for a pumping-station at the Swille

West Ham.—The Education Committee h decided to invite tenders for the erection o new handicraft centre at the Upton-l School. The Architect to the Education C mittee has been instructed to prepare pl for remodelling two departments of the Cla son-street School on more modern lines.

Westminster.—Various maintenance wo are to be carried out in three streets at estimated cost of 284*l.* The tender of Mes H. V. Smith & Co. has been accepted carrying out tar-spraying works in thirty-t streets (making a total of 117,610 super. y at 1¾d. per square yard. Consent is to given to Messrs. Harrods, Ltd., to constru subway under the footway on the north sid Brompton-road. A petition is to be presc in favour of the Housing and Town Plann

to., Act (1909) Amendment Bill. The following tenders have been accepted for paving the undermentioned streets with wood at the stated osts:—Improved Wood Pavement Company, Ltd., Gloucester-street, 3,243*l.* 4s.; Henrietta-treet, 576*l.* 5s. 4d.; Knightsbridge-green, 77*l.* 10s.; portion of Lees-mews, 230*l.* 12s. 6d.; Little Bruton-street, 152*l.* 7s. 11d.; Lowndes-lace, 610*l.* 0s. 6d.; portion of Mall-approach, 85*l.* 15s.; Motcomb-street, 773*l.* 19s. 2d.; portion of Portugal-street, 323*l.* 15s. 6d.; Semley-place, 1,147*l.* 17s. 5d.; portion of Spring-gardens, 172*l.* 2s. 11d.; Tilney-street, 95*l.* 17s. 6d.; portion of Vauxhall Bridge-oad, 2,121*l.* 18s. 8d.; portion of Vincent-quare, 1,284*l.* 1s. 3d.; portion of Westmore-and-street, 1,274*l.* 19s. 7d.; Messrs. William Griffiths & Co., Ltd., portion of Lupus-street, 220*l.* 16s.; portion of Grosvenor-road, 1,006*l.* 8s.; Cliveden-place, 1,013*l.* 2s. 6d. The enders of the Limmer Asphalte Paving Company, Ltd., and the London Asphalte Company, Ltd., have also been accepted for paving ith asphalt Chadwick-street, at 738*l.* 16s. 8d.; nd portion of Drury-lane, at 776*l.* 11s. 2d., espectively.

Willesden.—Tenders are to be invited for he erection of a caretaker's house at the esley-road School. Plans prepared by the ngineer have been approved for making up ortion of Wotton-road, Cricklewood. Tenders re to be invited, and application is to be ade to the Local Government Board for nction to borrow 2,053*l.*, for making-up ewbury-road and Donnington road, Harles-en.

Wood Green.—Plans have been passed for r. T. Stevens for additions to the Ranelagh ublic-house, Bound's Green-road.

OBITUARY.

Mr. P. Kerr.

The late Mr. Peter Kerr, of Melbourne, ictoria, was elected a Fellow of the Royal stitute of British Architects in 1889. In our ue of April 30, 1892, we illustrated his signs, with plans, elevations, and sections, r the Houses of Parliament, Melbourne.

Mr. E. T. Felgate.

Mr. Ernest Theodore Felgate, Lic.R.I.B.A., ose death also is announced, practised in ork, and, until a few years ago, in partner-ip with Mr. J. E. Hepworth—the firm of ssrs. Felgate & Hepworth, architects and evevors, was dissolved in December, 1906. r. Felgate was the architect of the Church nday-schools, and of several villas and other idences at Haxby, and, in 1909, of the nd stand erected for the exhibition of the xby and District Agricultural and Horti-tural Society.

FOREIGN AND COLONIAL.

ternational Building Exhibition at Leipzig in 1913.

With reference to the notice on p. 130 of *Board of Trade Journal* of April 20, 1911, ative to an International Building Exhibi-n to be held at Leipzig in 1913, it is notified t some further particulars have now been ived from the British Vice-Consul at that n (Mr. R. M. Turner). The exhibition will open from May till October; it is intended embrace all home and foreign products used building or for interior decoration, furniture fittings, and building materials of all ds. There will be eight sections, divided various groups, including, *inter alia*, ineering building works; decorating and nishing of interiors; laying-out of gardens parks; manufacture, preparation, and use various building materials; heating and ting apparatus; machinery used in the ding trades; and sanitation and fire pre-tion. Applications for space must be made he Directors, International Building Ex-tion, Leipzig, before October 1, 1912. A copies of the programme (in English) of exhibition, together with forms of applica for space, may be obtained by British s at the Commercial Intelligence Branch he Board of Trade, 73, Basinghall-street, don, E.C.

Russian Cement Trade.

r. P. Stevens, British Consul, reporting on trade of Batoum (Russia) for the year states that, with the great advance made ecent years in the use of cement for a ety of purposes, and more especially in ing reinforced concrete buildings, etc., the and for cement was very great. The Port-cement works at Novorossisk and Gelendjik were unable to keep pace with the consumption, and towards the middle of the year a serious cement famine occurred. Prices of cement rose to a fabulous level, and before long it became evident that steps for the importation of cement from abroad would have to be taken unless all constructional works requiring cement were brought to a standstill. Before prices began to decline, and the Russian cement works referred to were able to cope with the unprecedented situation, 1,342 tons of Portland cement were imported from Austria-Hungary, and a smaller quantity was landed for the harbour works at Poti. Extensive plants of the rotary kiln kind are now being erected at Novorossisk, Gelendjik, and Tuapse, and it is hoped, when these additional works are completed, a repetition of the dearth will be averted.

Building in Portuguese East Africa.

It is hoped shortly to establish a large first-class hotel and possibly a casino at Lourenço Marques, which it is felt would be extremely popular among visitors from the Transvaal. A fine hospital is in course of erection in one of the seaward suburbs, which it is hoped may be completed during 1912. One of the evidences of commercial improvement, however, lies in the growing demand for houses. Of these there is a decided shortage, and the want of medium-sized residences of a superior class grows more and more insistent. As a result a number of new buildings have made their appearance during the past year, but indications point to a prolonged period of considerable activity in the building trade locally.

Stoneware Pipes and Specials, Malta.

The Commercial Intelligence Branch of the Board of Trade is notified by the Crown Agents for the Colonies that sealed tenders will be received at the Office of the Receiver-General and Director of Contracts, Valletta, up to 11 a.m. on May 30, for the supply of stoneware pipes and specials. Tenders are to be accompanied by a deposit of 100*l.* If the tenderer does not reside in Malta, his tender must contain the name of a person residing in the island, to whom power must be given to represent the tenderer. Copies of the specification and form of tender may be obtained on application to the Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

Mills, Saskatchewan and Alberta.

The issue of the *Canadian Miller* for May states that a seven-story flour-mill with a capacity of 2,000 barrels per day and grain elevators with a storage space of 200,000 bushels, are about to be erected in Regina, Saskatchewan. The mill is expected to be complete and in operation by September, 1913. The same journal also announces that about 500,000 dollars (about 102,700*l.*) will be spent on the erection at Medicine Hat, Alberta, of a flour-mill with a capacity of 3,000 barrels daily, an elevator to hold 400,000 bushels, and a warehouse for 2,500 barrels.

Building in Bahia, Brazil.

The following information is from the report by H.M. Consul at Bahia (Mr. W. H. M. Sinclair) on the trade of that district in 1911, which will shortly be issued:—A great deal of activity exists in the building trade, both in the city and suburbs. In the lower city or business quarter numbers of old houses are being pulled down with a view to the construction of an avenue of modern buildings. The expenses of expropriation are being met by the Federal Government with the proceeds of a 2 per cent. tax on imports payable in gold, established in connexion with the harbour works (see *Board of Trade Journal* of March 4, 1909, p. 427). There is a growing demand for iron beams and girders, as well as for cement and building materials of all kinds. It is probable that elevators will be required if the new buildings are erected on the lines intended by the promoters of the scheme.

Sanatoria, Constantinople.

The *Zentral Anzeiger für das öffentliche Lieferungswesen* (Vienna) of April 21 states that Mr. S. Haimovici, of Bucharest, has formed a company with a capital of 3,800,000 lei (152,000*l.*) to be increased to 5,000,000 lei (200,000*l.*) for the purpose of constructing and working two open-air sanatoria at a place called Cury-Jalova, which can be reached in two hours from Constantinople.

Harbour Works, etc., Italy.

The following information is from the report by the British Vice-Consul at Syracuse (Mr. J. Lobb), on the trade of that district in 1911, which will shortly be issued:—

Owing to the lack of sufficient wharves and harbour accommodation at Syracuse, and to the increasing traffic as a result of the annexation of Tripoli and Cyrenaica, the Italian Government have under consideration a project and estimates for the carrying out of extensive harbour improvements, and the construction of a new railway-station, custom-house, and post-office for sorting letters, etc., arriving from Tripoli. There are also projects for harbour improvements at the port of Augusta, and during the year 1911 a large area of land near the wharf was levelled for the purpose of being utilised as a depôt for coal.

TRADE CATALOGUES.

Claridge's Patent Asphalte Company, Ltd., send us a pamphlet enumerating the uses and fire resisting properties of their specialty, and the purposes to which it may be applied with advantage in building and other construction. The principal constituent of Claridge's asphalt is the bituminous limestone procured from the mines at Pyrimont, near Seyssel, in France. This mineral is ground to a fine powder and mixed hot with a certain proportion of pure bitumen, a proportion of grit being also added, and the mixture run into moulds, forming blocks which weigh about 1 cwt. each. The pamphlet contains various practical notes of service to architects and builders, as well as illustrations showing methods of applying the asphalt in construction, and references to numerous buildings and structures where this material has been employed. Having been extensively used for nearly three-quarters of a century, this asphalt has amply justified the claims made on its behalf by the makers.

PATENTS.

APPLICATIONS PUBLISHED.*

8,102 of 1911.—Samuel Elliott: Casement or French windows.

10,274 of 1911.—Frank Edgeler Williamson. Heating systems.

11,133 of 1911.—Ben Henry Johnson and Frederick Rings: Concrete floors and like structures.

11,752 of 1911.—Bernard Charles Molloy: Windows.

14,960 of 1911.—Moses James Adams: Flushing apparatus.

16,485 of 1911.—Frederick George Hallett: Sash fasteners.

18,102 of 1911.—John Howard Cartland and Joseph Lilly: Gear boxes or brackets for the operating mechanism of fanlights, windows, and the like.

20,076 of 1911.—Dr. Johann Heinrich Schallenberg: Compositions for hastening the setting of cements and the like, and for water proofing them.

21,146 of 1911.—Allan Mortimer Hirsh: Sectional concrete pipes and methods of making the same by jointing.

22,215 of 1911. Michael Freeman Loundar. George Freeman Loundar, and William Freeman Loundar: Movable shelf brackets.

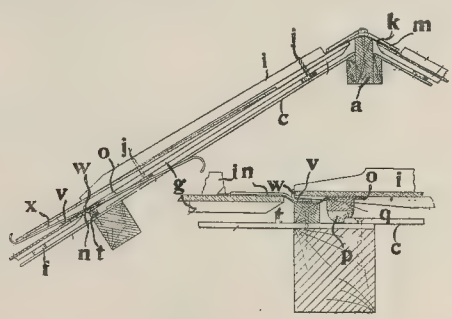
5,875 of 1912.—Percival William Flavel: Gas fires.

SELECTED PATENTS.

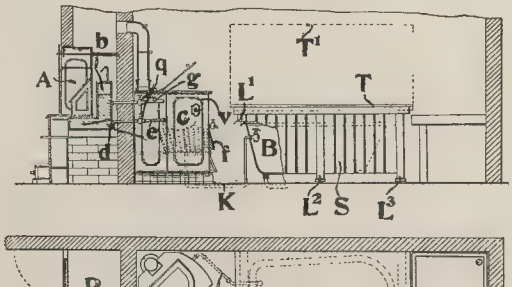
28,023 of 1910.—James Thomas Butters, of Messrs. Butters Brothers & Co., and Alexander Morton Hume: Cranes.

This relates to cranes as described in specification No. 25,292-1909, wherein the lifting-rope is automatically locked to the jib-head to support the jib when the supporting-rope breaks. An auxiliary rope is provided which is secured at one end to the crane post, and, after passing around a pulley G on the jib, is connected at its free end to a sliding weight I. A pivoted block J is held away from the pulley G against a spring N, by a rope K secured to the jib-supporting rope B, through

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.



28,023 of 1910.



a spring connexion P. When the supporting-rope breaks, the block is released and locks the auxiliary rope to the jib, which is thus supported.

28,764 of 1910.—Robert Hudson: Glazing roofs.

This relates to glazed roofs wherein the glazing elements are constructed to provide the glazed parts with a degree of flexibility, and to allow all cleaning and repairs being done from the inside. Flexible spars are secured to the purlins and support grooved sash-bars *g* on intermediate washers *f*; the glass panes are secured between the sash-bars and capping-bars of triangular section by screws *j*, which pass through the spars, washers, sash-bars, and capping-bars, and are manipulated from the inside of the building. At the rear the flashing-strip *k* is held down by wire springs *m* secured to the ridge member *a*, and the upper ends of the capping-bars *i* are cut V-shape to accommodate correspondingly-shaped portions of the flashing. Between adjoining rows of panes, flashing strips *n* are provided, supported on wood strips *t*, and held down by wire springs *v*, secured by the nails or screws used to secure the flashings and strips to the purlins, the upper ends of the springs being formed with upwardly-bent portions *w* to prevent glass panes from sliding down when the screws *j* are slackened. The upper ends of the flashings *n* are bent over at *o*, and are arranged either to leave ventilation spaces beneath the glass, or to make contact with the glass by blocks *q* supported on cork or other spring pads *p*.

28,764 of 1910.

28,838 of 1910.

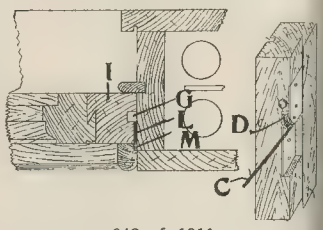
28,838 of 1910.—Frederick Bath Burby and Ernest Jones: Ranges, coppers, and baths.

This relates to combination apparatus for use in artisans' dwellings. The non-pressure boiler *b* of the range A is connected by circulating-pipes *e*, *g*, to the boiling-vat *c* of the copper C, which is provided with a fireplace *f*, for use when the range fire is not alight. Taps *q* in the pipes *e*, *g*, allow the copper to be isolated from the range boiler when it is in use for washing. A bath B is connected to the copper or the range boiler by a pipe K; in either case, a fire in the range or in the copper heats water for the bath. The bath is covered when not in use by a board T, the side S, and castor-supported legs L^1, L^2, L^3. The side S has also arms U, having a groove and tongue connexion with arms V projecting from the wall, so that the side S and top T are supported when drawn out to the position S^1, T^1, to form a partition. Curtains Z complete the enclosure of the bathing space.

29,379 of 1910.—Henry Charles Platts: Fireplaces.

This relates to an open domestic fireplace wherein a casing is secured to the front by nuts and lugs, and adjustable openings control the air supply to the fire. Doors are provided for the supply of fuel and removal of ashes, and a shoot formed to direct the fuel. The casing may be of transparent material; it may be in two or more parts connected by hinges, and may be mounted on wheels or the like for easy removal, or hinged to the fireplace.

495 of 1911.—Dr. Fritz von Emperger: Columns.



This relates to columns which are formed with a tubular iron lining, surrounded by concrete containing helical and longitudinal reinforcement. A flanged ring forms a support for joists. The lining may be built up of plates, and may have diametral partitions.

521 of 1911.—Samuel Stelling: Chimney-tops.

This relates to a chimney-top which consists of three superposed conical sections. The lowest section has an enlarged base, and the intermediate and inverted top sections are formed with vertical slots or openings, which may have diverging sides.

642 of 1911.—William Charles Jennings: Windows.

This relates to windows having sash-bars pivoted to sliding stiles, and wherein the sash-cords *C* pass down grooves *G* in the sliding stiles, under pulleys *D*, and are connected to the sashes, so that the sashes are balanced when in the turned down position as well as in the sliding position. The sash-cords are knotted, and are secured in bent plates on the sashes. The sliding stiles *I* are provided with plates *L*, which work in grooves *M* in the frame, to prevent the stiles *I* from coming away from the frame. The frame is provided with a false head to enable the upper sash to be turned down beneath the lower sash when raised.

642 of 1911.

648 of 1911.—William Charles Gilbert: Machines for mixing concrete.

This relates to apparatus for mixing the ingredients of cement and similar powdered materials in which the materials are delivered to the apparatus by a set of rollers with pockets, the rollers being driven by belt or friction-gearing, so that, in case of one roller jamming, the others can go on; also the edges against which the rollers work are so formed as to avoid jamming. The edge *e* against which the roller *a* works is rounded so as to press hard substances back amongst the material without jamming. The rollers *a* deliver into a chamber *c*, provided with inspection openings *q* opposite to the rollers. Unmixed material is fed to the chamber *c* by a conveyer *f*. The material is removed

PATENTS.—*Continued on page 651.*

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xviii.; Auction Sales, xxii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be purchased for publication by the Editor, whether they have been formally asked for or not

"Ideal" Registers & Ventilators.

"Ideal" Registers combine superior design and finish with strength and durability—they are made of cast-iron, therefore do not rust and can be fixed in any situation—are available in a great variety of sizes—can be promptly supplied in any colour or finish.

"Ideal" Plain Lattice Design Register.

Cast-iron Wall Frames are specially designed to hold Registers securely in position, are inexpensive, and can be masoned solidly into brickwork.

A large stock of nearly all sizes of Plain Lattice Black Japanned Registers is regularly carried at our Hull works.

Full particulars, illustrations, and prices on request.

We make "Ideal" Radiators and "Ideal" Boilers, and supply all Accessories required in connection with Low Pressure Hot Water and Steam Heating.

THE INSTITUTE ELECTIONS AND THE COMPROMISE.

By the time that these lines appear in print the Institute elections will have been decided and the members of Council, as well as those of the various Standing Committees, chosen for another year. We live in somewhat unsettled times, and the architectural body at Conduit-street has not of late years escaped the general feeling of unrest. Whatever may be the cause, the fact remains that guiding principles, established convictions, the straight path of direction, which ought to be followed by all purposeful men and institutions, have in recent times become a little uncertain. To-day is largely the epoch of the open mind and open door: both perhaps desirable things, but when the bolts are not locked o' nights there may be occasion for tremors on the part of the good housewife. When, in fact, the mind becomes too impressionable, too catholic in its views, it provides excellent soil for the seed of the revolutionary propagandist; and in such circumstances individuals as a party may be induced to commit themselves to a course of action which as private persons would be intensely distasteful to them. That is perhaps particularly the case when various antagonistic views meet on the common ground of compromise, and when those who hold them agree to sink personal convictions for the purpose of securing, by the adoption of a middle course, harmony of action. An understanding of this sort is, of course, creditable to all parties, and is often the only way out of an *impasse;* but it has its dangers, and its chief danger is that the party warfare which ought to cover a large area may be confined within narrow limits and decided on a single issue. The compromise which was arrived at a few years ago by two opposing sections of the Council and members of the Institute was of this nature. The canvassing, direct or indirect, previous to the present election indicated that this agreement has come to an end and that we have arrived at another stage of the conflict.

On the face of it, the position of both parties is pretty much where it was before the earlier negotiations; but actually this is far from being the case. Recent events have shaken or modified the convictions of both parties; the danger of a single issue policy in regard to an art and profession which involves so many issues as architecture is now apparent to all, even, we think, to the most sanguinary *sans-culottes* of the early days of the Registration movement within the walls of the Institute. The compromise, and this is its supreme advantage, has provided time for deliberation; it has cleared the air of some of the fog in which the question of Registration was involved. The Institute is, however, certainly committed to the policy, and we have no doubt that the present and succeeding Councils will do their best to influence Parliament to pass an Act which will mitigate the evils engendered by the unfair competition of unqualified men. But the neck-or-nothing policy which was behind the understanding of the compromise is now, we believe, for ever exploded. Registration, yes; but not Registration at any price—not at the sacrifice of what is best in architectural tradition, history, and practice.

Let us hark back a little and see how this matter concerns the Institute. It may help to make the position of both parties to-day a little clearer. That body had probably never attained a higher place in general estimation, whether public or private, when its members a few years ago showed some signs of being influenced by the Registration movement. The idea behind this movement was no new thing; it belongs in principle to schemes which had been discussed by the Institute pretty well since its foundation. The system of examination in architecture, the affiliation of the provincial societies, indeed the very existence of the Institute itself, were in effect an attempt to draw within closer lines architectural practice, and to make its scope more clearly defined and recognised. At the same time the disadvantages of a closed profession were obvious. The arguments advanced in support of this latter view are too familiar to need recapitulation. The main point is that the Institute had succeeded in definitely establishing its own position, and by consistent action in pursuit of the furtherance of architecture it had also established the position of its members. Membership denoted architectural qualifications and status of a reputable character. Students came from all parts of the world—from Australia, New Zealand, India, Canada, and South Africa—to pass its examinations. We all know what sacrifice of time and leisure these studies entailed on many of our younger men at home. Plainly, these qualifications would not have been so eagerly sought for if they had not been universally and amply recognised. Under the operation of the system of examination, therefore, the Institute was gathering into its fold the most promising exponents of the architectural profession; it was gradually closing the door, and it was doing it with wisdom and discretion, not with a bang. But that was only one phase of the Institute's work. As a consulting body and in the pursuit "of the general advancement of architecture," for which it was founded, its operations were extensive, and carried weight with the Government, the London County Council, the City Corporation, the promoters of competitions, and in other quarters where its action might be useful to the cause of architecture. That is to say, the Institute does not exist, and has never existed, for the purpose of promoting one architectural issue at the expense of others. It might be said, speaking broadly, that in seeking for the advancement of architecture it saw the progress of the architect and a more general recognition of his position in the hierarchy of art; but it realised that this could not be accomplished without time, patience, and a steady adherence to a progressive system of training which was becoming every day better organised and more firmly established. To the men who had at heart this traditional view the scheme of wholesale Registration was entirely distasteful. Instead of attaining the millennium, it would seem rather at one blow to shatter an edifice built on the surest foundations and constructed after generations of labour and care. The later phase of the Registrationist movement reversed the older policy; the first principle in its programme was the advancement of the architect. And it is no disrespect and no secret to say that the movement did not start with the men who by common consent were recognised both within and outside the Institute as the foremost in professional or artistic position and ability.

This was the state of affairs before the compromise. We have already attributed the highest motives to both parties who shared in that understanding. And if we ask how apparently irreconcilable views became united in a common programme we have no hesitation in saying that in either case the leading motive was—perfectly justifiably—one of respectable diplomacy. The wholesale Registrationists undoubtedly realised that they had no chance of making progress with a Bill in Parliament with the leading men in the profession against them. As we all know, it is not a difficult matter to block the further consideration of a Bill of this kind. But the Registrationists organised; they formed a strong Committee; at election time they threw over the house-list of the Council and nominated a group of men committed to their policy, and they were successful at the poll. We do not know that this Registrationist Council made much if any headway with their measure or were more successful than their predecessors in giving effect to the broader aims of the Institute. But its election convinced their opponents that the rank and file of members were in favour of the promotion of a Bill, and they were disinclined to act in opposition to so large and apparently convinced body of opinion. So the compromise was effected. And it was effected in this way. Those who were not in sympathy with the movement said, as it were: "If you are successful in getting passed an Act of Registration you will be obliged to include within its operation the type of man whose invasion of the profession is your special grievance; you will be obliged to give professional status to the Jack-of-all trades who cares to tag on to his name the title of architect; to admit the qualifications of those whom it has been the object of the Institute to refuse to recognise as of equal professional status, or indeed as of any architectural status at all. Let us at any rate lessen that evil. You have your own organisation at hand, the oldest and best established in the world, which through prolonged and disinterested service has attained influence and power which have operated beneficially on your behalf and in the cause of architecture generally. Instead, therefore, of committing yourselves to an Act of indiscriminate Registration, let us widen the portals of the Institute and admit a third class of members to be called Licentiates, men of some position who are too elderly or too busy to undertake an examination. You will then gather within your ranks the great majority of architects of creditable practice, who will be controlled by the regulations of the Institute and influenced by its aims. By this means one of the principal objects of Registration will be accomplished, and you will in any case be in a better position to proceed with your Bill." This was the basis of the compromise. It was acted upon. The Institute ranks have been increased by a large number of Licentiates, proposals for a Registration Bill have been submitted to the members, and yet what progress has been made? Very little, we fear. In fact, the difficulties, the pitfalls, which lie in the path of a scheme of this kind, recognised in the first instance by a few men, are now generally admitted by the majority of the members of the Institute. To the enthusiasts of the early days the issue seemed plain sailing if common action could be secured. But the recent discussions at Conduit-street on the question of the amalgamation of the Society of Architects have shown clearly enough that there are other issues of equal, if not of greater, importance; they also plainly demonstrated that members of the Institute, however desirous they may be for Registration, are not inclined to throw away the advantages of a hardly-won and well-established heritage. It has become increasingly evident that if the Institute is to retain its position among artistic and learned societies, that even if it is still to remain in possession of the dignity of its royal charter, the position of its members must be distinguished by more important qualifications than those conferred by an Act which involves vicarious recognition of the title of an architect. The tribulations of the past have made, however, for a better and clearer understanding.

An influential Committee has now been formed to consider the question of Registration in all its aspects, and we have no doubt that it will do its work honestly and well, and that, above all, it will profit by recent indiscretions and precipitate action. We do not wish to anticipate either its conclusions or its programme; but we may be well assured that any scheme which the Committee will ultimately present for approval to the general body will seek to lessen the evils with which it is unavoidably associated. The ultimate advantage of no art or

profession can be discovered in concessions which grant its imprimatur without first seeking to establish, in some sort, the credentials of those who seek it. Registration without qualification is impracticable. If architects are to preserve the respect of the public, of their brother artists and professional men generally, they must maintain a respectable standard of architectural practice and ability. They must, in a word, respect themselves. We have every regard for the disinterested views of many of those who would carry the Act into effect at any present cost for the future advantage of the profession. We do not quite say, with the lady in the old play, "Let posterity shift for itself"; but even in this aspect of the case posterity pays greater respect to ancestors who won their spurs in hard-won battles, and who carried the standard aloft in a great cause, rather than to those who raised their fortunes at the sacrifice of their convictions. However this may be, recent events have shown that in the fight for Registration the real conflict will not take place within the ranks of the profession, but outside.

NOTES.

Regent's Quadrant.

PROFESSOR ADSHEAD, in a letter to the *Daily Telegraph* on the threatened destruction of the distinctive charm of Regent's Quadrant, emphasises the fatal mistake of allowing the buildings to be heightened without giving any corresponding increase of width to the roadway between them. Although this has unfortunately been permitted in the case of the Piccadilly Hotel, he thinks that, "objectionable as it may be to break the continuity of the crescent, to do so would be far better than to aggravate a well-recognised error by persisting in the erection of what, from every point of view, has proved a false elevation." If we understand him aright, Professor Adshead would favour the rebuilding of the rest of the crescent to its present height, leaving the hotel to stand out two stories higher and so break the sweep of the skyline. If we could only bring ourselves to feel that there was the remotest chance that the resultant eyesore would rouse public feeling to such a pitch as to ensure its removal we should be ready to agree with him. There is no doubt this is the sternly logical way of dealing with the question. After all, the width of the street in proportion to the height of the building is an essential point. We fear, however, that, as we have said before, the lowering of the hotel and the rebuilding of the Regent-street front is hardly within the range of practical politics. This is not contemplated by the conditions of our competition, which, judging by the general interest it has excited, should provide some extremely able and interesting solutions of the difficult problems involved. The interest aroused by the attitude of the *Builder* towards the rebuilding of the Quadrant has stirred the daily Press. In the *Daily Telegraph* of Saturday, 1st inst., a sketch appeared which is full of suggestion as to the possible means of meeting the demands of the shopkeepers without sacrifice of artistic effect. The *Daily Telegraph* is to be congratulated upon calling public attention to such an important matter.

The Clergy and Architecture.

THE remarks made by Mr. E. S. Prior, the new Slade Professor of Fine Art at Cambridge, on the use of the capacity of the University to organise art study were of importance if only because of his observations on the relations of the clergy to architecture. "The Cambridge curriculum of theology sends out to nearly half the parishes in England incumbents and curates. Many come immediately into touch with some of the finest architecture and some of the most valuable records of art that our island holds." A knowledge, therefore, of what is in their hands to guard and secure would seem to be a part of their education, but "the tragedy has been that the knowledge has scarcely been given . . . most often not at all." Mr. Prior mentions the large part the clergy, with the best intentions, have played in the destruction of the religious art and antiquities "that 100 years ago our churches possessed," and he makes the practical suggestion that clerical students should take a course of historical English architecture and understand what this meant in churches. The truth of these remarks will not be denied by students of English church architecture who will call to mind cases of misplaced zeal on the part of clerical guardians, and it is to be hoped that the Slade Professor's remarks and his useful suggestion will not be forgotten, but that the proposed course of historical English architecture for clerical students may soon form part of the Cambridge curriculum.

Architects and the Corporate Sense.

THE suggestive paper under this heading which was read by Mr. M. J. Harris before the Transvaal Institute of Architects* is, we understand, the forerunner of an application to Parliament, praying (1) for the extension of the Transvaal Architects Act to the remaining provinces in the South African Union, and (2) for wider powers than are at present held under the Transvaal Act. Included in the author's remarks were some references to the Press attitude in Johannesburg and Victoria to the South African architect, and it is interesting to note that certain Press organs are very critical of the work of the architect. The interest for us in the matter is contained in the information that the South African Press appears to take notice at all, and not whether the criticism is unjust, as is suggested. We are afraid it cannot be said that the Press of this country is given to make much comment "coincident with the close of some public competition," and for our part we should welcome more comment, even though sometimes unjustifiable.

Survey of the Memorials of Greater London.

AS WE notice in our Book Review columns the new volume of the Survey relating to Lincoln's Inn-fields, the opportunity is afforded to call attention to the useful work of the Committee for the Survey of the Memorials of Greater London, especially as we are given to understand that few of the subscribers to the Survey are connected with the building trade. We are glad to notice that the negotiations with the London County Council on the question of its possible co-operation in the work of the Survey have resulted in the completion of a practical working scheme, which has received the official sanction of the Council, and a joint publishing Committee has been formed. The Committee hope that before the conclusion of the present year the second volume of the parish of Chelsea, which is being prepared by Mr. Walter H. Godfrey, will be issued, and already other members of the Committee are completing their respective districts. It should be mentioned that the area over which co-operation with the Council will extend is, at present, limited by the boundaries of the County of London, and such co-operation is only in respect of the parish Surveys. There will still be independent issue by the Committee of their fuller monographs on the more important buildings as time and funds permit. Those on Morden College and Cromwell House, Highgate, are already nearing completion, and will be produced very shortly. The Committee's collection of photographs and drawings has received considerable augmentation during the past year, and upwards of 350 different records have been added in that period. We hope that the work of the Committee will receive the more hearty and practical support of the architectural profession, and that such useful work will not be starved for want of comparatively small subscriptions.

Civic Responsibilities.

THERE is food for thought and comment in the fact that while representatives of most of the Borough Councils of London were discussing at No. 9, Conduit-street the minor problem of street name-plates a tragedy of error was being enacted a few hundred yards away. This "Piccadilly Blunder," as we have called it, has been the subject of fruitless negotiation for nearly a year, and it is probable that the suggestion lately put forward by Mr. John Belcher, R.A., that an arbitrator should be appointed, has been considered already. Whether by arbitration or by the pressure of authority, the new Denman House should be erected in harmony with and to balance the Piccadilly Hotel, which is the overwhelming portion of the block. To attain this end every effort should be made, even at the eleventh hour. As the Borough Councils have seen their way, rightly, to confer on the question of the efficient labelling of our streets, it may be possible for them to take action in combination to ensure the architectural character of the streets themselves. If a united protest by the municipalities could be made it might lead to the adjustment of the present dispute and to the prevention of similar difficulties in future. The present case calls attention to the need of a central authority to which all questions of taste including the fitness or otherwise of architectural works, could be referred automatically for consideration and report.

* See p. 661.

THE NEWER RESPONSIBILITIES OF ARCHITECTS.

AN extra general meeting of the Royal Institute of British Architects was held on Monday at No. 9, Conduit-street, W., the President, Mr. Leonard Stokes, being in the chair.

The minutes having been taken as read, Mr. William Woodward read a paper on "The Newer Responsibilities of Architects—the case of Minter *v.* Waldstein," of which the following is an abstract.—

Having referred to the present-day interference in the performance of his duties that beset the architect as compared with forty or fifty years ago, and to the "rush" now attending work, the lecturer said that the more serious results of this regrettable modern necessity are that architect and builder are made responsible for defects which would not arise if a proper amount of time were allowed. The plaintiff was the well-known builder of Putney, Mr. F. G. Minter; the defendant Professor Waldstein, of the University of Cambridge, his architect being Mr. F. W. Foster. The clerk of works was Mr. L. W. Green. The architects who gave evidence for the plaintiff were Mr. William Woodward and Mr. F. W. Foster; and Mr. H. T. A. Chidgy, the quantity surveyor, also gave evidence for the plaintiff. The architects who gave evidence for the defendant were Mr. John Murray, Sir Alexander Stenning, and Mr. E. B. l'Anson. The contract, which was in "the Institute form," was to make certain alterations and additions to a large country mansion in Cambridgeshire, named Newton Hall. The total cost of the works, including many additions to the works included in the contract, amounted to the sum of about 21,000*l*. The defendant, besides denying that he was liable to pay the sums last certified, pleaded a counter-claim for damages and recovery of certain sums which he asserted were improperly included in progress certificates. Some 400 items were set forth by the defendant as those to which he objected, and the bill of variations on the contract prepared by the quantity surveyor, Mr. Stanbrough, occupied 327 pages.

The author then gave the history of the case (see the *Builder* for the following dates in 1911: July 14, 21, 28; August 4, 11, 18, 25; October 20, 27, and November 17) down to the trial by Mr. Muir M. Mackenzie, and said that some important points, as affecting client, architect, and builder, are involved.

"1. *Dismissal of the Architect.*—Mr. Muir Mackenzie finds that the authority of the architect to give the certificate dated January 20, 1911, had not been previously revoked; that the architect was on that date the architect for the purposes of the contract, and that he had authority to give the certificate. The defendant alleged that the letters of January 19 operated to determine the architect's employment and his authority to give a certificate after that date. Mr. Muir Mackenzie raises the question whether an architect can be effectively discharged from his office by the employer alone, and he quotes cases bearing on the point. It seems that the architect, being the one agreed upon between the parties, cannot be discharged by the employer alone. The defendant placed reliance on Clause 3 of the Articles of Agreement, which provides for the nomination by the employer, subject to objection by the contractor, of a fresh architect in the event of the death of the one named in the contract, or his ceasing to be the architect for the purposes of the contract, but Mr. Muir Mackenzie decided that that clause did not operate. There is an important matter, however, involved in this decision of Mr. Muir Mackenzie's, and that is that an architect's certificate might not be justifiably held to include for work outside the work contemplated in the contract; and I gather that he decides that "in regard to all extra work ordered, either under the contract or in circumstances which created in the defendant a liability to pay for it, the provisions of the contract, as to payment, were to be observed—*i.e.*, that on the one side defendant was not until completion of the whole works liable to pay except on the interim certificates of the architect, and then only for the amount certified, and that, on the other side, the certificates were to include the price of all the work ordered as above mentioned." He decided that the contention failed, which, I presume, means that in this particular case the architect *was* justified in issuing certificates for work which, although not specifically included in the contract, were executed with the cognisance of the employer, and were therefore subject to all the conditions of the contract.

2. *Position of the Quantity Surveyor named in Clause* 13 *of the Contract.*—This clause specifically names a surveyor who is to measure and value all authorised extras and omissions, and provides for a copy of the bills to be given to the contractor. Mr. Muir Mackenzie decides on this point that, where the particular surveyor named in the contract has measured and valued additions for which the defendant was liable, under the contract, or an omission properly authorised, then such measurement and valuation are decisive.

The Clerk of Works.—The clerk of works in this particular case gave many orders and directions, probably by the architect's authority, which were obeyed as usual by the foreman of works. Mr. Muir Mackenzie decides that the clerk of works had no power or authority of himself to authorise or permit the contractor to disregard Clause 7 of the conditions of contract.

The Alleged Defects.—The evidence on these alleged defects was of the most contradictory character. Apart from the other evidence given, that of the architects giving evidence was in direct issue. I, for the plaintiff, stated that with the exception of certain small items of defects in floor partition and roof construction, for which in my opinion the plaintiff was not liable, the defects in the house were those which one expects to find in all new buildings; that these defects were, in this particular case, intensified by the wet season of 1910 (the year in which the work was done), and by the abnormal heat from the abnormal number of radiators which the defendant requested to abnormally warm his house. I further said that the defects due to the plaintiff under his contract could be all made good in a month, and at much less cost than the 500*l*. which was retained in hand, in accordance with the contract, for the very purpose of meeting such defects.

Mr. John Murray, Sir Alexander Stenning, and Mr. E. B. l'Anson, for the defendant, stated that the defects were due to bad materials, bad construction, and bad workmanship, and in violation of the terms of the contract and of the specification. That no such making good as I had mentioned would be sufficient, and that the new building was in a dangerous condition, should be completely gutted, and the interior reconstructed with materials and workmanship in accordance with the contract and specification.

Responsibility.—It is important now to consider upon whose shoulders the responsibility for all these serious allegations should rest, and Mr. Muir Mackenzie decides that, so far as the clerk of works is concerned, he (the clerk of works) had no power or authority of himself to authorise or permit the contractor to disregard Clause 7 of the conditions of contract.

Then, as to the responsibility of the architect for the quality of the timber and general construction of the roofs and floors. Did he by way of authorising or allowing the deviations excuse the plaintiff wholly or partly? In Mr. Muir Mackenzie's opinion the authorities show that, in a contract like this, the power of the architect to order or sanction variations does not empower him to authorise departures from the terms of the contract which involved the substitution, in the whole or part of the work, of "inferior" materials and workmanship for those prescribed and charged for in the contract price, so as to prejudice the strength and stability of the building.

Mr. Muir Mackenzie has arrived at the conclusion that in this case the acquiescence of the architect in the wider spacing of the joists in No. 6 room, and his permission to the builder to supply timber of a description and quality inferior to that which the plaintiff contracted to supply did not absolve the plaintiff from his obligation to fulfil the contract and specification in regard to the timber, or prevent the disregard of the specification and other conditions of the contract from being a breach of the contract, and Mr. Muir Mackenzie decides that in regard to the two matters above mentioned the plaintiff committed breaches of the contract.

Mr. Muir Mackenzie has evidently been at very great pains to arrive at a just decision as regards the roofs. He finds that there are defects in them, and that they are less sound and well constructed than the roofs to which the defendant had a right under his contract, but that the plaintiff is not wholly responsible for the inferior condition, "some of it being the inevitable result of the change of design by the architect and the direction to the plaintiff to use the trusses and materials obtained from the roofs originally designed, and carry out the change of design as best he could," and Mr. Muir Mackenzie had treated the alteration to the twin roof "as part of a duly authorised variation." As regards some of the other matters of complaint, Mr. Muir Mackenzie considers that they were mainly due to the variations introduced by the architect and the manner in which he required them to be carried out. Other alleged defects, which Mr. Mackenzie specifies, have not, he says, been established to his satisfaction.

Mr. Muir Mackenzie next deals with the defendant's attacks on the *joinery* as being bad in material and workmanship. He states his opinion that, as regards the 'quality" of the wood, the onus of proving that it was inferior and unseasoned was on the defendant, and that he has not discharged it.

Power to Order Extras.—Another matter of some importance, raised in this case, was with reference to what were, and what were not, authorised *extras*. The defendant's contention was in effect that no extra works could be charged for unless authorised by writing or drawings signed by the architect, or by a written approval after having been done. The plaintiff contended, in opposition to this, that he (the plaintiff) was entitled to be paid for all additional or extra work or materials which had in fact been ordered or sanctioned by the architect, or by the clerk of works, or by the architect's deputy or assistant, or by the defendant or his wife, or had been rendered necessary in consequence of variations so ordered or sanctioned. On the construction of these clauses Mr. Muir Mackenzie found in favour of the defendant.

A Few General Observations on the Case.—I cannot help expressing my regret that the plaintiff was not allowed to do what he was perfectly willing to do, and in fact was bound to do under Clause 17 of the contract, and that was to go down and make good all defects which had appeared in the house before Mr. Foster was superseded by another architect.

As regards the responsibility for making good defects arising from faulty construction—construction designed or acquiesced in by the architect—it does seems to me most unfair that the result of this should be placed upon the shoulders of a builder.

Mr. Muir Mackenzie has not, I think, laid down any clear and decided opinion as to this, but he rather judges each item on its merits. I have hitherto thought that, as regards defective materials and workmanship, the builder is responsible, but that as regards the mere carrying out of the designs and directions of the architect, the architect or the client was responsible for bad results. H.M. Office of Works deals with this particular matter in a manner to my mind quite fair. There is a clause in their contracts which runs as follows:—"But if any failure shall have arisen in the work, or any part thereof, by reason of a defect in the design of the architect, then the builder shall not be responsible for such failure, and the same shall be made good as extra work under Article 7 of these conditions if so required by the Commissioners."

There can be little doubt that the many actions which have been fought during the last few years have brought to the front responsibilities and troubles never before realised by architects and builders. Our present conditions of contract do not provide in any way clearly for the settlement of these troubles, and it becomes day by day more urgent that these conditions of contract shall be revised, for the protection alike of client, architect, and builder."

Mr. H. D. Searles-Wood
proposed a vote of thanks to Mr. Woodward for the able and impartial analysis of the decision in the case he had dealt with, and he suggested that the paper, as well as other papers relating to the same subject, should be referred to the Practice Committee with a view to that body drawing up a short guide for modern practice.

Mr. H. T. Hare seconded the motion.

Mr. M. B. Adams
said he did not know whether any reference would be permissible to a practice which did not exactly apply to the particular case before them, but with regard to which it appeared to him some measures would have to be taken. He referred to the system now prevailing both amongst architects and engineers for specialists to be called upon to prepare designs for the use of ferro-concrete, and then for the specialists to seek out certain contractors to carry out the work, the designers undertaking to be responsible for any defect which arose from any fault of theirs in the way of design, whilst the contractors were to be liable if it could be shown that there was any deficiency in the materials they supplied or in the manner in which the work had to be carried out. As the result of such divided responsibility the difficulty was to ascertain in actual practice who was really responsible. The specialist designer said: "If I were called on to do this over again I should do it precisely as I have designed it," and the contractor, introduced by the middle man, who was a specialist, said: "My materials are perfectly accurate. If you can find out any point in which they are wrong I will be responsible." He knew of a case in which a structure was erected for a Corporation and it did not properly fulfil the object for which it had been built, and what he had described really took place. It looked as if the matter would have led to litigation at enormous expense, but in the end the employers, the specialist, and the contractor each paid 100*l.* to put the matter right, and probably for that 300*l.* they avoided legal expenses of 2,000*l.* He asked if something could not be done to fix responsibility more closely than this. They might imagine a young architect having to deal with an experienced architect and a very capable specialist, and with the employer coming down on him in regard to responsibilities which he ought never to have engaged in. What he had described was gradually becoming more and more the practice, and it was very desirable that some definite scheme should be decided upon so that the difficulty could be fairly and clearly met.

Mr. G. A. T. Middleton
drew attention to the fact that in the case before them timber had been specified which it was practically impossible to obtain. These antiquated clauses were often found in specifications in the country, although perhaps not so much in London. He would like it impressed on architects all over the country that they should bring their specifications of timber and steel and particularly of cement up to date.

Mr. W. H. White
hoped that the subject raised in the paper that night and in previous papers would not be allowed to drop into obscurity, but that something would be done for them, particularly for the advantage of the younger men. He considered some committee should be appointed by the Institute to revise these obsolete clauses in the specification so as to suit modern practice. They could search the text-books through and through and then find they were deficient in the practical information they required in their everyday practice. In Minter's case and in most contracts there was an arbitration clause, and why such clauses were so weakly drawn as to permit of litigation before there was an arbitration was a mystery to him. If the arbitration clause were so worded as to make an arbitration precedent to legal proceedings heavy expense would be avoided.

The President: I have heard it said it is cheaper to have a law case than an arbitration.

Mr. White said that was one of the points which should be dealt with.

The President: To make the arbitration cheaper than the law?

Mr. White said he thought so.

Mr. W. H. Satchell
said the specification of timber was known by those who understood to be generally hopelessly out of date, and architects generally were blamed for that. He hardly thought that was fair, because if there was one subject more difficult to know about than another it was timber. Until quite recently there was not a single text-book on timber from the timber merchant's point of view. Their offices were inundated with pamphlets, but scarcely one gave the architect any idea of what timber was in the market. Therefore, if the architect specified sizes no longer imported and brands which were not available he could hardly be blamed because a busy architect could not afford the time to go down to the docks and see what was obtainable. If the Institute could in some way convey to those concerned the desirability of informing architects what could be obtained it would be a great advantage, and there would be less excuse for the mistakes which were now made. It was generally specified that the very best timber only should be used, and the same specifically applied to a cathedral and a cottage. Obviously when such a specification came before the Courts the judge did not feel in sympathy with an architect who expected in a close-cut competition job for a small work the same material as would be used where money was no object and where the work was measured and the building was of national importance.

The President asked if it was a fact that seasoned wood behaved more badly than inferior stuff.

Mr. Woodward said that what he meant was this. Where the wood was more seasoned it was more receptive to dampness than wood less seasoned. His experience was that well-seasoned timber sucked up the atmosphere more than other timber.

The President: You would not expect to put wet timber into a building?

Mr. White said the drier the timber the more absorbent it was. He had had the case of an old house which had been painted thirty or forty times. The windows were taken out during the wet season and the moisture got into the house and the panelling absorbed the moisture, and when the rooms got dry the shrinkages were greater than was usually the case in a new building.

The President: It is rather a dangerous theory to encourage young men to put in bad joinery.

Mr. White said it was not a question of bad joinery, but of dry timber in a wet building.

Mr. Woodward said he was working in an old building in the New Forest, and they painted some old panelling which had not before been painted, with the result that there was considerable shrinkage.

The President: Wet makes it expand as a rule.

Mr. Woodward: It did not in this case.

Mr. Searles-Wood said it would expand first and then shrink.

Mr. Saxon-Snell remarked that when timber shrank it also twisted, but good timber only shrank.

Mr. White observed that badly-seasoned timber would give rot, whilst well-seasoned timber, although it would shrink, would not rot.

Mr. Osborne Smith
thought a great deal of the trouble in the case they had heard of was due to the builder unwisely carrying out the instructions of the clerk of works which the clerk had no authority to give. It was the architect's duty to write the specifications and to see that the work was properly carried out, and not leave things to the clerk of works. If the architect did his duty a great deal of trouble would be avoided.

Mr. Langston
did not consider that there were any new responsibilities on architects, but the public were waking up to the defects of incompetent architects. Architects were suffering from their faults, and it behoved them to do better. He would give an instance. They were sitting in a room that evening in regard to which the legislature had laid it down that there should be exit doors, and yet one exit door was locked. Who was responsible for that? Was it they who should sit in judgment on their fellows? Let them raise themselves to do their duty, which was nothing new, but simply a recognition of doing their duty towards their neighbour.

Mr. Geen
agreed that the responsibilities on the architect disclosed by the case dealt with were not new responsibilities, but were as old as the Roman law, and always had been the responsibilities of architects in this country. Touching on the various points raised in the case, Mr. Geen said it would probably be news to some architects that *primâ facie* the architect had no power to order extras, but the owner could give him authority. If it were otherwise it was obvious that the architect would have power to ruin an owner by ordering the most expensive extras. The owner could, of course, give the architect authority to order extras to either a limited or an unlimited amount, and it was the duty of the builder to inquire as to the extent of the architect's agency. If the architect professed to act as the agent of the owner, but had in fact no such authority, then the architect was personally liable. When an owner discharged an architect it was his duty to immediately give notice of the fact to the builder, and it followed that an architect would not be right in giving a certificate after he was discharged. If the builder did nothing when he had notice of the architect's discharge then he acquiesced in the matter.

The President
said the paper had been full of puzzling points. He wished it had never arisen, for it would be much better if they could be avoided. When once they got into the clutches of the law or of the arbitrator it was very difficult to make it clearly understood how the case stood. The result was that an award was given which they could never look upon as a final clearing up of the points involved, because often the judge or the arbitrator had got a little off the lines and they could not make the case fit others which might come after. They were all liable to go wrong and were too obstinate about their rights, but it was much better to deal with such matters in a give-and-take fashion if the owner and builder would agree. After all, a bad job always had to be put right, and it costs more to get the lawyers to put it right. Mr. Wood had suggested that some sort of guide should be compiled to help young men. It might be advisable, but they ought to be careful how they laid down hard-and-fast rules to guide young men, as cases altered with conditions.

The motion having been passed,

Mr. Woodward,
in reply, said he had always understood that the architect had the power as the agent of the employer to pledge that client's credit practically to any amount, and in the case before them Mr. Muir Mackenzie said that if the extra ordered was for the benefit of the structure, then the architect was justified in ordering it. He had inquired over and over again of lawyers who had taken part in their discussions as to this question of agency, and had never been able to get a satisfactory reply as to the general power of the architect to order extras without the cognisance of the employer. Even Mr. Muir Mackenzie left the point very ambiguous. He agreed that it was the variations from the conditions which caused the trouble in this case to arise, and he knew that the clerk of works had no power to order things without the sanction of the architect, and that the builder should not have carried them out, but it was done every day. The value of such discussions as these would be to warn architects that they were far too free and easy in carrying out their works. He hoped that the suggestion with regard to the mediæval character of the timber specifications would be carried out. He did not know where timber came from and did not care, and so long as it was good and sound, healthy timber he let it go in. He agreed with Mr. Adams that there would be trouble with regard to ferro-concrete work, and that the question would arise as to what extent the architect was responsible for the serious shifting about of the contract relations. Mr. Middleton had referred to cement, and there was an enormous amount of so-called Portland cement from Germany and Belgium being used. Architects ought to see that real Portland cement was used. He had been in arbitrations conducted by lawyers and by architects, and certainly the cases were far better understood when conducted by architects. In the case of timber, for instance, if the specification said it was to be Riga timber, the lawyer held that it must

come from Riga irrespective of the question of whether there was any available, whereas the architect used his common sense. He agreed that the architect should write his own specification and not leave it to the quantity surveyor.

The President announced that the next meeting—a business one—would be held on June 10.

REGISTRATION OF ARCHITECTS.

In the Supplement to the last issue of the *Journal* of the Royal Institute of British Architects the following letter appears:

"To the Editor, *Journal* R.I.B.A..

SIR,—We, the undersigned, whose names were appended to a circular issued by the Institute Members' Club under the above heading, wish it to be known that we were not consulted as to the issue of this circular and did not see a copy of it before it was issued.—Yours faithfully,

REGINALD BLOMFIELD,
WILLIAM DUNN,
WILLIAM FLOCKHART,
W. A. FORSYTH,
JAMES S. GIBSON,
WALTER TAPPER,
SEPTIMUS WARWICK,
EDMUND WIMPERIS."

ANCIENT MONUMENTS IN MIDDLESEX.

AT a meeting of the Middlesex County Council, on the 30th ult., a letter was read from the Commissioners of Works inviting the Council to co-operate in the preservation of ancient monuments and historic buildings, and intimating that where the expense of preserving monuments of national importance is heavy it might fittingly be defrayed from national rather than local resources. Acting on this suggestion, the General Purposes Committee made inquiries in the county, and now recommended that the following list of buildings, earthworks, and ancient monuments be forwarded to the Office of Works as worthy of preservation:—

The London Stone.—Said to have been placed on Lammas land at Staines about 1270, with the intention of marking the western boundary of the City of London.

Hogarth's House, Chiswick.—Where Hogarth spent much of the latter part of his life, and where many of his works were produced.

Bury Hall, Lower Edmonton.

Headstone Grange, Pinner.

Grim's Dyke, Harrow Weald.

An Obelisk near the Grove Estate, Little Stanmore.

Lamb's Cottage, Edmonton.

Old Mansion in Pymmes Park, Edmonton.

Salisbury House, Bury-street, Edmonton.

Building at east end of Church-street, Edmonton.

Monument in Acton Park.—Designed as a memorial of James Radclyffe, Earl of Derwentwater.

Garrick Temple, between Thames-street, Hampton, and the river.

The Old Pie House, West-street, Harrow.—Specimen of old domestic building of uncertain date

Tower of St. Mary's Church, Hornsea.

Cromwell House, Highgate.—Erected in the XVIIth century, probably by a member of the Springwell family.

The Treaty House, Uxbridge.

Traces of Roman encampments at Heathrow, Harmondsworth, and at Shepperton.

An ancient barn on Sir Samuel Boulton's estate at Totteridge.

An ancient barn at Harmondsworth.

Agrimensorial Marks.—Stones at Wealdstone, Whetstone, Sudbury, and Bordestone.

Saxon and Danish Moats.—Camlet, Old Bury, Tottenham (three), Hanworth, Pinner, Enfield, Northolt, Alperton, Acton, Ruislip, Down Barn.

THE CHURCH BUILDING SOCIETY:

THE CRAZE FOR CHEAPNESS.

THE Bishop of Chester, who presided recently at the annual meeting of the Incorporated Church Building Society, at Church House, Westminster, stated that modern churches had been so indifferently built that they were falling down. Dry rot frequently appeared in the fabrics of churches and vicarages, foundations were bad, and one vicarage, although it had been built only forty years, had completely fallen down. The services of the Committee of Honorary Consulting Architects were invaluable to them in this connexion. The Committee might also advise them with respect to the positions organs should occupy. The fashion of putting the organ in what Sir Frederick Bridge had described as "meat safes" at the chancel end of the church had had a mischievous effect upon congregational singing.

Mr. Walter Tapper, F.R.I.B.A., a member of the Committee of Honorary Architects, said: "Speaking for your Committee of Architects as a body, I think I may say that they are glad that their duties are in the main confined to seeing that the plans which come before them comply with the excellent practical requirements of your Society, because if minute criticism were expected from them on the æsthetic side I am not sure but that some of them would depart this life at an earlier period than would perhaps be otherwise the case. That many of the designs, if they may be honoured by the title, show clearly enough that there is room for vast improvement cannot be doubted. It may, I think, be fairly assumed that they represent the prevailing ideas regarding church building, and I am bound to say that if the works of the old masters be accepted as a standard by which they should be judged, and no better can, I think, be suggested, the modern plans compare badly with the old ones, and leave little room for congratulation. It may be instructive, if not altogether agreeable, to consider why this is so.

The fine arts do truly reflect the character of the people who produce them, and it may be taken for granted that because our old churches embody the necessary qualities of dignity, repose, restraint, reverence, and modesty, which combine to give them their devotional character, the same qualities were to be found in the people who caused them to be built and in those who designed them.

If, on the other hand, modern architecture be looked at from the same point of view there must surely be very grave doubts whether the same fine qualities prevail to-day.

I think that the lack of fine architecture in this XXth century is not entirely the fault of the architects, and I am sufficiently optimistic to believe that were it demanded it would be supplied. It is the demand which is wanting. There is no lack of inventive power, quite the contrary, but it is applied rather to mechanics of all kinds than to the fine arts, so that the art of fine building, at least so far as our churches are concerned, is, broadly speaking, and by comparison, almost at a standstill, and, in my opinion, this state of things involves considerable moral loss to us, though this deduction may be one on which there might be much argument.

As our efforts are thus directed, so the wealth of the country follows them and we naturally get the cry for cheap churches. Your report draws attention to the distinction between cheapness and proper economy, and wisely so. It is, however, regrettable that economy need be so prominent a requirement in so noble a work as architecture when we consider the wealth of England at the present day.

This requirement of cheapness may well be our undoing, just as easily perhaps as the luxurious tendencies of the age in which we live. Though, for the reasons given, large sums of money are seldom spent on individual churches, yet much is being spent on churches in the aggregate, and it is the essential difference between "cheapness" and proper economy which should be borne in mind. The practical application of the latter in church building should be made by the omission of fussy and meaningless detail and vulgar ornament. mean decoration, painting, furniture, and fittings, and the money thus saved should be devoted to sound building with fair proportions.

Improvement in this respect has been made during recent years in some degree, but it must be admitted that the cheap and nasty church furnishing shops still flourish like green bay-trees, and the handicraftsman who would give thought and care to each individual thing is as one crying in the wilderness.

It became the fashion some fifty years ago to arrive at the cost of a church by reckoning so much per sitting, and 10*l.* was the accepted sum. The fashion still prevails, notwithstanding the great increase in cost of both labour and materials, and the result to-day is a building inferior in some respects even to those of half a century ago. What can be less inspiring to the architect than to be asked to build on such lines? One can hardly imagine those simple old devotional village churches of ours being so erected, to say nothing of the great cathedrals and minsters.

I take this opportunity of pleading for higher ideals in this respect, and suggest that it would be wiser for the architect to be told the amount of the funds available for the structure and be asked to build so much as can be done properly for the money.

Such a course need not lead to extravagance, for it is only fair to assume that architects have some common sense and would understand the prevailing conditions in each particular case. The question of accommodation should not be permitted to dominate the matter; this difficulty can be overcome by some temporary adjunct to the permanent work. I make this suggestion believing that it would tend to better and more honest building, to say nothing of finer architecture.

To build a portion well is surely better than to put up the whole in an inferior manner.

Hogarth's House, Chiswick: From the Garden.

Future generations may add as the opportunity occurs. This is no new-fangled idea, but one adopted in the heyday of church building and with the best results. Churches of fair proportions with all the qualities which go to make fine architecture would once more rise in our midst instead of the many poor, mean, unworthy ones we now so often see. Unconsciously perhaps, but none the less really, these latter must have a demoralising effect on the minds of men. If it could be but more realised that the beauty of our churches and, for that matter, of our homes and general surroundings is as necessary for our better moral welfare as the sun in the heavens, we should be building better things. No one admires the efforts of those responsible for the building and repair of our churches more than architects, and no one realises better the need of encouragement to the parish priest entering upon such an uphill task. It is all the more necessary that funds so hardly gained should be the more wisely administered. Much progress has been made in this respect, but even to-day we find the beauty of our old churches woefully marred. Only last week, in one of the finest churches of the country, I saw the meanest piece of material placed as a dossal, bad material both in texture and colour, and so mean that one would hesitate to use it anywhere. Behind it was a glorious XIVth-century window. Apart from any question of cost, I ask whether as a place to pray in would it not have been well to be content with the fabric itself until something more worthy of the building could have been introduced.

We see the same ill-effects in cheap mural decoration, in bad drawing, in bad figures, and in bad colour, so distracting that a white-washed wall would be much more suitable and a great relief to the eye. If we cannot have the best at the moment, let us be content to wait. So, again, with furniture; a lectern, we will say, is considered necessary, and a brass thing of no merit whatsoever is introduced. Surely it were better to read from a well-printed book held by the hand than to suffer the introduction of foolish-looking or offensive furniture. Such things can have no good influence, I believe, but quite the contrary.

Just recently the Archdeacon of Halifax thought it necessary to call attention to the innumerable badly-painted windows which are placed year by year in the churches of his deanery. Better by far is the simple glazing than such tawdry stuff. If it were not so serious it would be almost humorous to think of what is done to-day in the name of art, and I fear that the standard of taste is not likely to improve until the "man in the street" takes a real interest in architecture, and before that happens he must, I believe, have the same grip of the Faith which enabled our forefathers to build and to adorn their buildings so splendidly."

The Bishop of Manchester complained that cheap sites were chosen in back streets. Other denominations selected the main thoroughfares, but they did not send a clergyman to buy the site. Laymen were empowered to make the purchase, and they did not have to say at the time what the site was required for. He advocated that the question of church sites should be dealt with centrally, and any money advanced to parishes for the building of churches should be by way of loan rather than grant.

ARCHITECTS AND THE CORPORATE SENSE.

AT the monthly meeting of the Transvaal Institute of Architects, held at Johannesburg, on April 19, Mr. M. J. Harris read an interesting paper, entitled "Architects and the Corporate Sense," the President, Mr. H. G. Veale, presiding.

Mr. Harris, who is the Hon. Secretary of the Institute, said: "By the corporate sense in its relation to architects I mean that civic conscience the existence of which in architects is, or should be, betokened by a regard for the duties we owe to one another, to our profession, and to the State; and by a consciousness of what is due to our art, and to architects collectively, by the State and public.

On grounds of historical accuracy some may question the view that the corporate sense is a newly developing quality in our profession, and may urge certain evidences as to the existence of co-operative schools or guilds in the ancient and mediæval periods of architecture. Be that as it may, the architect, as we understand the term, is a comparatively modern development, no longer merely the artist builder directing his skilled craftsmen, but a specialist having many complex responsibilities and faced with a multitude of problems undreamed of in the simpler civilisations of former days. And, similarly, many problems which confront the corporate sense of the modern architect are of a new nature, solution of which cannot be attained by any study of precedent. Any inquiry as to historic precedent for the corporate ideal among architects will thus, if interesting, be of small practical use. It is of more serious import to consider how far the corporate sense is in existence among us.

Of Professional "Ishmaels."

Sociologists place this sense, the civic consciousness, high in the scale of human progress. By analogies drawn from observation of extant savage races, and from the growth of human consciousness in the individual, some have deduced stages of evolution through which prehistoric man advanced towards civilisation. From barbarian beginnings in which the cruder animal instincts and the gratification of personal desires formed man's sole mental equipment, they argue developments in which the love for kindred, for tribe, and for race successively appeared. Without actually adopting any such theories, it is easy to imagine a similar course of evolution in regard to the development of the corporate sense among architects. We are, unfortunately, only too familiar with those instances in our profession where self appears to be the one consideration; too well aware of that attitude which, in effect, cries aloud, "I am the artist, and in art there is My school and none other"; of those instances where our code of ethics and of professional usages have been dishonourably set at naught. Their hand set against their brethren, these are the Ishmaels of the profession—each of them the extant barbarian whose selfish attitude would constitute him the base of the evolutionary argument.

Safeguards of the Code.

It is, however, a satisfactory evidence of the extent to which the corporate sense does obtain among us that throughout the civilised world architects have banded together in associations and institutes such as ours for the furtherance of common professional aims. Standards of qualification have been set up; codes determined embodying, from wide experience, the minimum fees or charges compatible with honourable practice; clearly defined rules have been laid down demanding our proper conduct of the high responsibilities which fall to our lot in discharging the duties we owe to those who entrust us with the direction and care of their enterprise and interests. The recognition of a code of ethics among all artists and professional men is, in fact, universal. If this were not so, if artists and professional men—the seers and prophets of our day—were not alive to the dangers of the increasing commercial tendency of this age, we should all, ere long, be shrieking our wares in the market place and bidding against one another in values of intellect and of worth of soul to obtain the favour of popular patronage. How much intellect and how much soul would survive the market? It should clearly be seen that the code of ethics is a necessity in the highest interests of art and of civilisation.

Such are the grounds on which our associations and institutes are rightly jealous of any infringement upon the safeguards afforded by the code. Ostracism from the ranks of his fellow artists is the extreme penalty meted out to the offender. But, in certain flagrant cases of callous offence, ostracism is obviously no punishment. The law will punish actual crime, but cannot be invoked against those who infringe certain of the professional safeguards. If our previous statement—that these safeguards are necessary in the highest interests of art and of civilisation—be established, then our law is proved inadequate to the needs of our time. It is to the corporate sense among us that we must look for a formulation of those needs that shall inform State and public as to the urgency, upon grounds of national import, of newer legislation. When, by such formulation, our corporate duty has been performed I trust that we shall not need to labour the point in regard to the duty of the State towards furthering and encouraging the honourable civic ideals of associated professional men and artists.

Competition and Public Buildings.

The mention of State encouragement brings us naturally to a consideration of the State policy in regard to public buildings, as affecting the evolution of a national architecture. If we do not feel this question deeply, sincerely, then, indeed, in the corporate sense we must be dead. . . . Those of us whose possession of the corporate sense is not merely fragmental will always hold that public buildings of a country should represent the highest artistic talent in that country, and that that talent should be discovered in every instance, or introduced by means of competition open to every artist. We do not suggest that such competition be limited to the artists of the country, but that only the very highest obtainable talent should suffice. Strange as it may appear to a succeeding generation of artists, our State policy in regard to the design of its buildings has alternated from (in one favoured instance) the bestowal of patronage to the departmental method. More strangely still, the departmental method has been restricted to the designing of its buildings, and has not been extended to their construction, which latter is still carried out under the system of competitive tender by builders. One would have thought it more logical to carry out construction departmentally, and to obtain the designs (in which the personal factor is of vital importance) by the competitive system. A clear case of topsy-turvevdum! And, what is more serious, a clear indication that the Government of our country is unaware of, or indifferent to, the high desirability that its architect citizens be given that incentive to emulation in their art which can be afforded by the holding of open competition whenever one of the public buildings of the country is to be designed; that, in short, the Government of our country is unaware of, or indifferent to, the true need for its encouragement, and not discouragement, in the development of a South African national architecture.

"Majores ad minores," the Government's example has to some extent influenced municipalities. In a recent instance, when several valuable pictures were presented to a municipal art gallery, the donors flouted the entire body of practising architects in this country by an insistence that the building, which was to be erected out of public funds, should be designed (without competition) by an architect having influential practice in London. This by way of encouraging South African art!

The Opponents of Competition.

It would be unreasonable to expect a disinterested view of the competitive system from those who will sacrifice all else for the gratification that is theirs when bestowing patronage, from those who habitually receive such patronage, or from those whose personal advantage is best served by every increase of departmental responsibilities. The opposition to the competitive system, both in this country and elsewhere, is almost invariably traceable to these sources and their tributary influences. Nepotism and court favour are, happily, less evident here than in older countries, but they have made their appearance, and have been justified on grounds of art!

I cannot devote further time to elaborate this aspect of my subject. Much remains to be said as to the manner in which competitions, when held, have at times been shamelessly thwarted by those who nominally were the promoters, and by the faulty awards, for transparently interested motives, of certain assessors. Suffice it now to say, in anticipation of our opponents, that the competitive system, where it has failed in the past, has failed for lack of that proper honest use without which every instrument must fail. And thus we have come to a further demand on the corporate sense among us, requiring the service of our collective and individual influence to arouse public opinion upon the means now adopted in the production of its national architecture.

Education.

But our responsibilities and duties do not end there. We cannot hope for sympathy in our strivings for the highest expression in art unless we carry the understanding of the public as to the aims and advantages of art. Ours should no longer be the "still small voice" which nowadays nobody hears; propagandist programmes and the support of all liberal education schemes, both within and without our profession, seem to be necessary to our progress—nay, to our continued existence. Education within our profession, in order to

maintain a high standard of ability among artists who may be trained within our own borders; education beyond the confines of our profession, the better to counteract the uncertain tendencies of a democracy without culture. It is our duty as architects to see to it that our educational systems shall not produce a race artistically atrophied. South Africans have been decried as an inartistic, unimaginative, and unmusical race. We know it is not so. There is, nevertheless, much to be done in certain quarters to overcome the apathy which owes its rise to an impression that art is the exclusive interest of the lank-haired, the be-spectacled, and the anæmic. We live in a vigorous colonial atmosphere, and, where academic abstractions fail to attract, the methods of the constructive artist may succeed in leading to higher things.

Schools of Technology.

In connexion with the question of education, it would be impossible to pass without appreciative reference to the efforts made by our Government in the institution of the excellent classes now conducted at the various schools of technology and at so-called "trade schools" throughout the country. Care must be taken that the rudimentary instruction there afforded shall never be regarded as in any sense obviating the necessity for apprenticeship, for professional training, and practical experience. If vigilance in this respect be relaxed we must expect to find an abundance of that partial knowledge which is proverbially dangerous—to the detriment of the general efficiency. Nor can appreciative mention be withheld from the individual action of Mr. Herbert Baker in founding a scholarship enabling selected South African students to attend the British School at Rome. It would, of course, be easy to over-estimate the value of classical study; some of the most impressive architecture in the world was produced without the slightest inspiration from the classic tradition, or by men who had never travelled further than a hundred miles from their native town: nevertheless, the source of culture thus made accessible to the more fortunate of our students has opened up certain possibilities for which they, and we, are grateful to Mr. Herbert Baker, who has given out of his success to the honour of the profession to which he belongs.

Influence upon State and Municipal Bodies.

The further duties which devolve upon us in the corporate sense, and to which duties I can only briefly refer, are those of the influence we should exert upon State or municipal authorities in connexion with legislation affecting town planning and cognate matters, and in supporting any one of our number when occasion demands in litigation which may result in precedent affecting the interests or the status of us all.

Referring to the first-named matter, that of town planning, the lack of any corporate power to exert this influence is sadly evident, even in the comparatively young town of Johannesburg. Many a fine street is terminated by a mean vista of hideous structures—I could name many instances—and the worst feature of all is that surviving evidence of the old-time Boer prejudice against the Johannesburg population—the "Fort." The dominant feature of our landscape is the gaol, and we go our daily round and send our children to their schools under that frowning reminder of the punishment that awaits transgression of the law. When our corporate sense obtains its full power we may prevail upon the conscience of those responsible to allow us a better and more inspiring outlook.

Press Attitude.

So far I have mainly dealt with our duty to the State and public. Certain duties of the State, and the attitude of the public as indicated by the action of State and municipalities, have also been considered. I propose to conclude with some considerations as to the attitude of the mentor of the public—the Press. It is distinctly depressing to recall that in all the discussion which has taken place at various times on matters deeply affecting the practice of our art the main attitude of the Press, or, at all events, a large portion of that which comes under our notice in Johannesburg and Pretoria, is distinctly unfriendly to the South African architect. It matters not that he it was who designed, not discreditably we hope, the many fine buildings erected at Cape Town, Port Elizabeth, Durban, and elsewhere throughout the country (to say nothing of Johannesburg and Pretoria) during the past twenty years. Certain of our Press organs are wont to write about our art, deplore that it is not art, to regret that it is so poor, or so unnational, or so uncharacteristic, or so unsuited to our climatic conditions. All of us have seen such comment; its appearance is generally coincident with the close of some public competition or during some discussion when the claims of other than the South African or of other than the luckless competitors are to be advocated; at whose behest the advocacy we can merely conjecture. But is such comment just, is it justifiable on any ground of either patriotism or of art? Let the conscience supply the answer.

We cannot, however, attain our just ends save with the co-operation of a just and honest Press. In the existence of such—"a righteous remnant"—is our hope. The Press, the greatest factor in the evolution of democracy, is the indispensable ally, without whose aid we cannot hope to succeed in our plea to the fair sense of democracy.

When our corporate sense has been endowed with corporate power we shall perhaps have a further means wherewith to persuade Government, municipalities, and people that local art should be fostered and encouraged, not discouraged, as "the visible flower of civilisation, reflecting honour upon the race that has produced it."

THE STUDY OF ART AND ARCHITECTURE AT CAMBRIDGE:

THE SLADE PROFESSOR'S PROPOSALS.

MR. EDWARD S. PRIOR, the new Slade Professor of Fine Art at Cambridge, dealt in his inaugural lecture with the use of the capacity of the University to organise art study.

In Art, he pointed out, there are two sides—the recipient art and the executive art. There is he for whom art is made and he by whom it is made. There are thus two faculties which the University has the capacity of training—that of the public and that of the artist. It must consider that its students will be purchasers as well as purveyors, clients as well as architects. Art study has to teach a man to know art when he sees it and also to teach a man to make art when he can. By instituting art study at Cambridge the University has taken on itself the office of both teachings.

Archæology and art must be coupled together, and for the right use of archæological knowledge in the education of the general student a right understanding of artistic value is necessary and should be taken account of in art study. The lecturer also pointed to what Cambridge has undertaken in its school of Architectural Studies. Among the 4,000 students who are on the books, the University is bound, he said, to get certain natures in whom the potential instincts of the artists develop a passion for making, ordering, and shaping—a passion as natural as that of reproduction. Why in these cases should the potential artist be sterilised because he has come up for a University education? And more, the University will now attract to its curriculum the best kind of artist student—one that is ambitious to face the world as a citizen with a practical public career. He is entitled to claim from the University the full education of his time—the full draught of knowledge that a University can give, its spacious outlook, and the temper of its communal associations. But this being so, the training offered has to be to the purpose—not merely a book knowledge: the A B C of facts; it must be in the craft of the artist's trade. But the student, before establishing his claim as a specialist for architecture, should show that he has interest in the practical forms of art and has the instinct of handicraft. The power of the artist is a distinct physical idiosyncrasy—a predisposition necessary for training in art, and it is cruelty to force it on the unfit. He should, secondly, give proof that he has the capacity for understanding the elements of a practising art. Architectural training is no good as a refuge for the mentally incompetent. When the student understands himself as an artist, the history of art and historic archæology become for him a new thing. The achievements of the past are studied, not as a story, but as an exercise. It is not what was art in ancient times, but the way of it now. Forms and handlings come before him in their evolution, and he tests their achievement by his own experience.

The Slade Professor said that the programme of an archæological and architectural school must be closely condensed for University purposes, but he believed the programme could be regulated by strictly keeping to the principles of practical art instruction and specialising to this end in the direction of the constructional arts. He emphasised that the only just education of the artist, at the start and all through, is making him competent to meet present-day conditions, with the present-day materials of art. He must be equipped from the beginning to take those conditions seriously and to experiment in them. The student of art must start with his handicraft. He must draw and understand what a line means. He must model so as to understand how form is constituted. He must colour and know what tone and shade express. The lecturer went on to say that they wanted in Cambridge continuation studies in archæology and architecture, in which students with the bent of investigation may obtain the habits of observation and comparison on which archæological discovery rest.

The Clergy and Architecture.

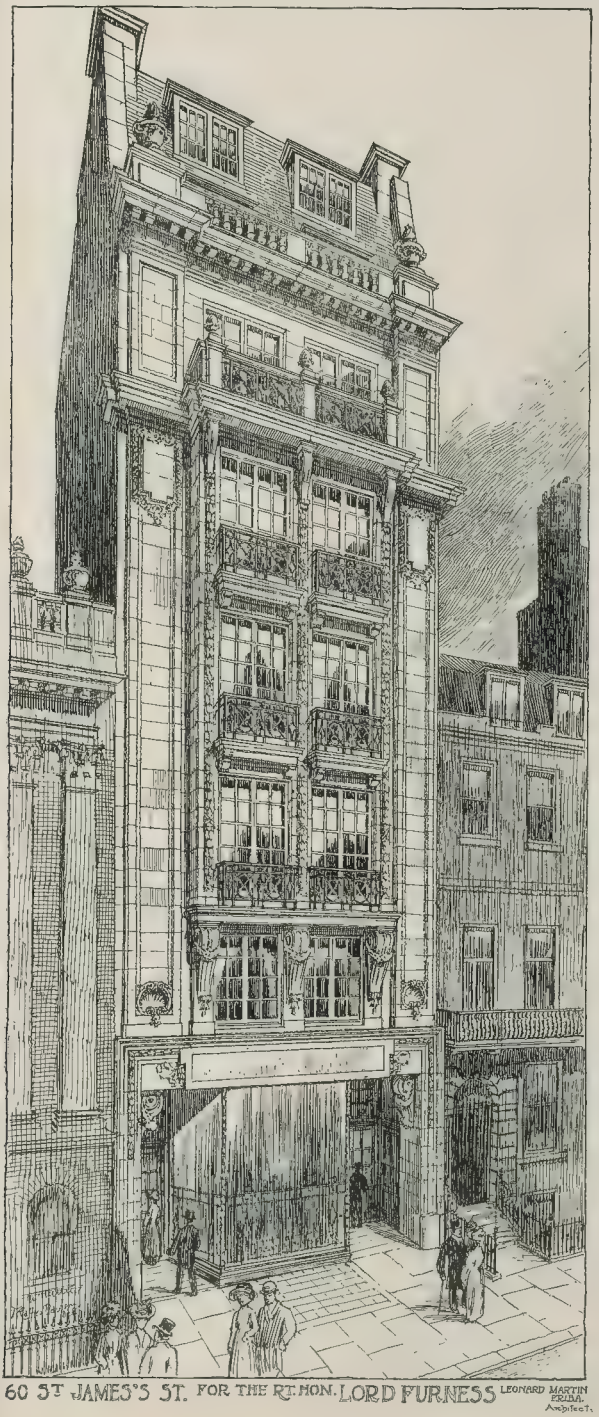
There is another special class, for whose needs a school of archæology and architecture ought long ago to have been instituted. The Cambridge curriculum of theology sends out to nearly half the parishes of England incumbents and curates. Many come immediately into touch with some of the finest architecture and some of the most valuable records of art that our island holds. Our ancient cathedrals and parish churches come under the care of Cambridge graduates, who often obtain what is practically the power of ownership to do what they will with the ancient religious art. With them lies often the decision whether the genius of ancient English art shall be preserved or destroyed. A knowledge of what is in their hands to guard and secure would seem a part of their education. The tragedy has been that the knowledge has scarcely been given only by chance, by individual effort, or most often not at all. It is a tragedy that with the best intentions, and often with pathetic exertions to understand, clerical guardians of priceless treasures have been so ignorant (despite a University education) so unstudied in the ideas of religious art, that they have wiped out in the last century a very large part—he believed he should say the greater part—of the religious art and religious antiquities that 100 years ago our churches everywhere possessed. While there are still art treasures for the Church to keep, would it not be to the advantage of the clerical vocation if clerical students took a course of historical English architecture, and understood what this meant in churches? A school of art preservation in connexion with clerical training would also have its proper home in Cambridge in connexion with a continuation School of Archæology and Architecture. In most ages the religious art has been the popular art, and the artist has found his best client in the churchman. But for the last 100 years this alliance has lost its bond. He could count on his fingers the occasions when acknowledged painters and sculptors of the English school have in the last 100 years been allowed to show their art in our cathedrals and churches. For the most part the edifices of public worship take nothing from any genuine artist. Would it not be an advantage for every candidate for Orders to be given the opportunity of associating with and understanding the artist—at any rate to the extent of taking at its worth what in our churches is often degraded stuff?

[We are indebted to the *Times* for the above report.]

LLOYDS' BANK, MIDDLESBROUGH.

The new premises for Messrs. Lloyds' Bank, Ltd., have been erected from the plans of Messrs. Hoare & Wheeler, architects, of London. The front is formed of green Buttermere stone at the base and the upper part is of Stainton stone. On the ground floor is the bank-room, 28 ft. by 23 ft., with a marble floor, private-room, manager's-room, and cloak-room. The upper part of the building has been given up to offices with a separate entrance. The contractor is Mr. Henry McNaughton, of Middlesbrough, and the strong-room is by Milners' Safe Company, Ltd.

No. 60, ST. JAMES'S-STREET.



THIS building, which immediately adjoins Brookes's Club, has been erected for the Rt. Hon. Lord Furness as his West-end offices, from the design of Mr. Leonard Martin, F.R.I.B.A., of No. 17, Waterloo-place, Pall Mall, S.W.

Externally, the building is of Portland stone of Renaissance character. The upper floors are arranged as high-class bachelor flats, and are decorated throughout in the same character, the woodwork being of polished mahogany with fibrous plaster enrichments to walls and ceilings. A general kitchen with staff-rooms is arranged in the two floors in the roof for the use of the flats.

The upper part is approached by a separate entrance, with a push-button electric lift to the various floors.

A similar character of decoration is introduced into Lord Furness's offices on the ground floor and basement.

The general contractors were Messrs. G. E. Wallis & Sons, of Maidstone; the carving was by Mr. Mabey, of Vauxhall Bridge-road. The internal fibrous plasterwork was by Messrs. G. & A. Brown, of Hammersmith-road, and the lift was by Messrs. Hammond & Champness.

60 ST JAMES'S ST. FOR THE RT. HON. LORD FURNESS LEONARD MARTIN F.R.I.B.A. Architect.

ARCHITECTURAL SOCIETIES.

Bristol Society of Architects.

The Bristol Society of Architects have instituted a series of Saturday afternoon sketching expeditions during the summer months. The first of these took place to Chelvey and Nailsea Court. The members were received at Chelvey Church by the rector, who gave an interesting description of the building. The Manor House was next visited by the courtesy of Mr. and Mrs. Cottle, the fine old staircase and panelled rooms being greatly admired. Some time was devoted to sketching and measuring the architectural details of the Church Manor and barn, after which the party proceeded to Nailsea Court, the residence of Mr. Charles E. Evans, where the members were welcomed by Mr. and Miss Evans. This delightful old house, with its recent additions and wealth of antiques, is of much interest to the architectural student. Apart from preserving the original building, Mr. Evans has collected and saved from destruction many valuable architectural works of historical importance, most of which have a connecting-link with former owners of the house. Some of these have been incorporated in the new additions, carried out under the supervision of Mr. Arthur Stratton, A.R.I.B.A.

Royal Institute of the Architects of Ireland.

An ordinary meeting of the Council of this Institute was held at 31, South Frederick-street, Dublin, on Monday last. The President, Mr. A. E. Murray, R.H.A., F.R.I.B.A., was in the chair. There were also present: Messrs. W. Kaye-Parry, L. O'Callaghan, H. Allberry, A. G. C. Millar, J. H. Webb, F. Hayes, G. P. Sheridan, F. G. Hicks, Professor Scott, and C. A. Owen, Hon. Secretary.

The minutes of the ordinary meeting of May 6 and of the special meeting of the 16th were read and signed. A large amount of correspondence was dealt with. A discussion arose as to the projected public meeting to be held in connexion with the School of Architecture at the National University, and the committee dealing with the subject were asked to report on the present position of the matter. The question of nominating an assessor for the forthcoming competition for the new Municipal Buildings was under review.

A motion in connexion with the scheme of examination was considered, and referred to the Examination Committee. Professor Scott was appointed to draw up the particulars for the Institute Prize, to be competed for by members of the Architectural Association of Ireland.

THE SURVEYORS' INSTITUTION:

VISIT TO NOTTINGHAM.

THE annual country meeting of the Surveyors' Institution was held at Nottingham on the 30th ult., the Hon. C. H. Strutt presiding at the business meeting.

Mr. Bernard Everard read a paper on the Derwent Valley Water Board's scheme, and the members visited the works the following day.

Mr. G. Turville Brown, in the course of a discussion on Mr. George S. Bragge's paper on the coal and iron industries of Notts and Derbyshire, said that since the Eight Hours Act came into operation the coal trade had been carried on at a loss. Surveyors must be very careful not to make values upon the evidence of coal extraction in some of the older districts.

Annual Report.

At the annual general meeting of the Institution, which was held in London on Monday, the forty-fourth annual report of the Council was presented and adopted. The Council record an increase of 205 members over the total at the end of the Institution year in 1911, making a grand total of 4,705. We take the following extracts from the Report:—

Members will feel a deep sense of personal bereavement in the death of Mr. T. M. Rickman, whose interest in the Institution as Fellow, Examiner, Member of the Council, and as President had been for the last thirty-nine years of the closest nature. Mr. Rickman's colleagues on the Council in particular must miss an influence which has always been directed towards the highest ideals of the profession, both educational and ethical; while many a young surveyor, especially among those who practise in quantities, will feel the loss of a sympathetic friend whose wide experience and sage advice was always at the service of those who needed them.

Reference should also be made to the death of Mr. Arthur Harston, London (1890), whose kindly presence will be much missed at the Institution meetings, where he was one of the most regular attendants.

The main item calling for comment in the balance-sheet for 1911 is the sum of 7,058*l.* paid on account of the building extension referred to later in this Report. This payment was partly provided for by the 2,500*l.* brought forward on deposit at the beginning of the year.

The receipts from the hire of rooms were necessarily affected by the building operations, and fell from 442*l.* to 212*l.*, but there are indications that this loss will be more than made up during the present year.

The Examinations, 1912.

The large increase which was recorded last year in the number of candidates presenting themselves for the Institution Examinations has been continued, the total, 1,223, being 318 in excess of 1911, which in its turn was 152 more than the highest previous record. As then stated, this marked growth in the number of candidates must be attributed largely to a natural desire on their part to qualify for election to the class of professional Associates before the door is closed in October, 1913, to all who have not passed the Intermediate and Final Examinations. Another factor having a considerable influence upon the total has doubtless been the establishment of the great valuation department at Somerset House, the higher posts in connexion with which are only open to those who have qualified by examination, the Institution Examinations being recognised by the Civil Service Commissioners for this purpose.

Among the 1,102 candidates who came up for the Professional Examinations were 102 who had been referred back in their typical subject on a previous occasion and presented themselves for re-examination. Of the twelve "Land Agency" candidates in this category nine passed; of the thirty-four "Valuation" candidates thirty passed: and of the fifty-six "Building" and "Quantity Surveyor" candidates forty passed, thus completing their respective examinations.

Scholarships at the Universities.

The successful candidates for the Institution Scholarships tenable at the Universities of Oxford and Cambridge respectively were: Mr. R. R. Davis at the former, and Mr. B. C. Adkin at the latter. For those in connexion with which the choice of the educational centre is left to the successful candidates, Mr. P. Whalley headed the list, and will hold his at Manchester University, while Mr. T. B. Manson, who came second, has chosen Glasgow University.

The Council would remind members that candidates for these latter scholarships have the advantage not only of selecting their University, but also of deciding upon the course of instruction they will take, subject only to the condition that the course must be one approved by the Council as appertaining to the surveyor's profession.

Publications.

The gold medal for the best paper read at an ordinary general meeting during the session 1910-11 was awarded by the Council to Mr. E. H. Blake for his paper entitled "Some Notes on Highway Law as Affecting Property Owners." The President had a difficulty in deciding which was the best paper sent in to be read at a junior meeting during the present session, and finally bracketed Mr. F. S. Eden and Mr. E. Page as joint winners of the President's Prize. Their respective papers, "The Simplification of Land Transfer" and "Some Notes on Reinforced Concrete Construction," will be found in Part I., Vol. XVIII., of the *Professional Notes*.

The Library.

The library has benefited by a valuable bequest of topographical, architectural, and other books from the shelves of the late Mr. T. M. Rickman. In particular this includes a fine set of John Britton's works on the history and antiquities of the English cathedrals, besides other volumes of a similar character.

There has also been added to the library by purchase an interesting portfolio of drawings, engravings, and lithographs, illustrative of the various structures known as London Bridge from 1209 to 1831. Members who feel an interest in antiquarian London should take an opportunity of looking through these.

The Forestry Museum.

The Forestry Museum has been redecorated, the old exhibits being removed preparatory to some being remounted and others replaced by new specimens. The work of reorganising the collection must necessarily be slow, but it is hoped that by next autumn a number of the new exhibits will be in position. It is proposed that the museum should comprise a typical collection of English timbers, together with specimens of the industries, pests, and other matters connected with English forestry. With this object in view, in addition to the botanical cases, the exhibits dealing with pruning, creosoting, etc., and the collections of seed and cones, the following special exhibits are being installed:—

(1) Examples illustrating wood industries and the commercial utilisation of timber.

(2) A complete exhibit of willows in connexion with the manufacture of cricket bats.

(3) Boards and sections of the various timbers grown in this country.

(4) Models and specimens of fungi affecting trees.

(5) Photographs of notable trees in the British Isles and of good examples of English and Continental forestry.

The cases of injurious insects are being remounted, and by the addition of such further specimens as are needed this section will be brought practically up to date. Specimens of timber used in constructional work, showing the common and botanical names of the tree, together with the alternative names by which the timber is known, will be included. By this means it is hoped as far as possible to cater for the different branches in which members may be interested, and the Council confidently appeal to members to aid in this object by sending to the museum specimens of practical interest in order that it may become thoroughly representative.

The Institution Premises.

The extension referred to in the last annual report has now been completed, the back of the old building having been thrown out over Princes'-mews as far as the new street separating the Institution from the Guildhall of the Middlesex County Council, which is now in course of erection. By this extension the lecture hall has been somewhat lengthened and its acoustic properties greatly improved; the Council chamber has been nearly doubled in size and made more worthy of the Institution; further reading, smoking, and lavatory accommodation has been provided for members on the ground floor; and the secretarial and staff offices have been conveniently placed together at the back of the building, thus allowing a more effective supervision, and adding to the efficiency of the work.

The Council feel that Mr. Paul Waterhouse, the architect, is to be congratulated upon the addition he has made to the building erected by his father; they confidently anticipate the extension will add to the comfort of members and receive their cordial approval.

The lecture hall has been further adorned by the addition of three portraits to those already hanging on its walls; that of the Right Hon. Lord Alverstone, G.C.M.G., Lord Chief Justice of England, by the Hon. John Collier, which was painted on the instruction of the Council to commemorate his lordship's twenty-five years' membership of their body and as some acknowledgment of the obligation under which the Institution stands towards him for the valuable assistance and advice which he has so freely placed at its service during that period. The other two, which were painted by private subscription, are a portrait of Mr. Daniel Watney, also by the Hon. John Collier, and one of Sir Alexander R. Stenning, by Mr. P. Tennyson Cole.

An important departmental committee, under the chairmanship of Sir John Kempe, K.C.B., has been set up by the Treasury to inquire into the changes which have taken place in the relations between imperial and local taxation since the Report of the Royal Commission of 1901.

As a result of the appointment of this committee, a Land Conference was called to consider the effect of an extension of the principle of taxing site values, which it is understood was one of the principal points upon which evidence was taken. All the more important societies connected with urban and rural landed interests were represented, and forms were drawn up with the object of showing actual results in existing cases.

The Hon. Edward Gerald Strutt has been elected by ballot President for the ensuing year, in succession to Mr. W. E. Horne, M.P. The Vice-Presidents for the year were elected as follows:—Mr. Howard Chatfeild Clarke, F.R.I.B.A., Mr. E. B. I'Anson, F.R.I.B.A., Mr. W. E. Woolley, and Mr. John Farrer; and there were added to the Council Mr. J. H. Sabin, Mr. James Inglis Davidson, and Mr. John McClare Clark.

ARCHITECTS AND THE LABOURERS (IRELAND) ACTS.

A CORRESPONDENCE has recently taken place between the Royal Institute of the Architects of Ireland and the Local Government Board for Ireland as to the qualifications of persons employed as architects under the Labourers (Ireland) Acts

Mr. C. A. Owen, B.A., F.R.I.B.A., Hon. Secretary of the Royal Institute, wrote on April 2 to the Secretary of the Local Government Board, Ireland, mentioning that when the rules and regulations under the Labourers (Ireland) Act, 1906, were being considered some correspondence passed between the Council of the Royal Institute of the Architects of Ireland and the Board, when the Council of the Institute pointed out that the draft regulations relating to the qualifications of these persons and the scale of their remuneration were not such as would induce skilled architects to seek employment in connexion with buildings to be erected under the Act. The Council felt it their duty to invite the Board to consider the disastrous results both to the ratepayers and also to the occupiers of the cottages which were bound to follow the employment of unqualified persons as architects. They also wrote in similar terms to the Chief Secretary, who, in his reply, stated that the Board "held" – and he regarded their view as reasonable—that the work of an architect in connexion with schemes under the Labourers Act did not require specialised knowledge. That experience," wrote Mr. Owen, "in the working of the Act has not confirmed this view is shown by the following extract from the *Freeman's Journal* of February 21, 1912:—

"Few Unions in Ireland are better provided with labourers' cottages than the Union of Kilmallock; but a report, which recalls Mr. Birrell's advice to the Councils to be more vigilant as to the character of materials and workmanship employed, indicates that the condition of the houses necessitates a very large outlay in repairs. A meeting of ratepayers passed a resolution, stating 'That we fear the stupendous sum of 140,000*l.* which has been borrowed and spent up to the present in the erection of labourers' cottages has been (inferring from the Inspector's report) wasted to a great extent in the erection of badly-built houses. That the amount of money spent in the repairs of cottages is also something to cause alarm.' The ratepayers suggested that a fully-qualified engineer 'possessing a University degree,' should, in the interests of economy, be appointed to inspect the cottages periodically. The Rural District Council has unanimously adopted the resolution. Twelve or eighteen months ago the Council ordered that a sum of 2,100*l.* should be spent on repairs, but, according to a member of the Council, many of the labourers are sick in consequence of the condition of their houses."

"My Council," proceeded Mr. Owen, "are aware that the experience of the Kilmallock Union is by no means singular; that much dissatisfaction prevails throughout Ireland on account of the excessive annual cost of repairs to the cottages already built, and they therefore desire me respectfully to suggest to your Board that the time has arrived when the regulations dealing with the appointment of architects under the Act may be amended, so that, with skilled supervision, future cottages might be more carefully constructed, and thus diminish the cost of maintenance."

The reply received was as follows, from the Assistant Secretary of the Local Government Board, Ireland:—

"The Local Government Board for Ireland have had before them your letter of the 2nd inst. relative to the qualifications and remuneration of persons employed as architects under the Labourers Acts; and they desire me to direct your attention to the amendment of Rule 50 (f) of the Labourers Order of 1906, as contained in Rule 48 (f) of the Labourers Order, 1912, a copy of which is enclosed for the information of the Council of the Royal Institute of the Architects of Ireland.

Mr. Owen, in the course of his response, wrote:—

"The Council, having compared the rules in the Orders of 1906 and 1912, are of opinion that the amendment of Rule 50 (f) of the Order of 1906 as contained in Rule 48 (f) of the Order of 1912 will not have the effect of ensuring that only skilled persons shall be employed as architects in connexion with schemes under the Act.

The Council have already pointed out that they consider the scale of remuneration as laid down in the Order of 1906 is not such as would induce skilled persons to seek employment as architects, and they (the Council) fail to find in the Order of 1912 any Rule authorising increased remuneration.

The Council are confident that if the remuneration were adequate there would be no difficulty in getting properly qualified persons to act as architects, and they therefore trust that the Local Government Board will reconsider and amend the rules relating to the qualifications and remuneration of persons to be employed as architects under the Act."

The following letter was written, by order of the Chief Secretary, to Mr. Webb, who was Hon. Secretary of the Institute in the year 1907. It is referred to in the second clause of Mr. Owen's of April 2, 1912:—

"Irish Office,
Old Queen-street,
London,
May 27, 1907.

SIR,—With reference to your letter of May 6, enclosing a copy of the correspondence which has passed between the Institute of the Architects of Ireland and the Local Government Boad, I am desired by the Chief Secretary to say that he has given careful consideration to the Institute's representation that the result of the scale of fees proposed for architects' work in connexion with schemes for labourers' cottages is that inferior men are appointed, with results detrimental to the public interest.

In reply, I am desired to say that among the new provisions of the Act of 1906 is that contained in sect. 27, which provides that any person whom a District Council propose to employ as an architect shall satisfy the Local Government Board that he has sufficient knowledge and experience for such employment.

Rule 50 (1) of the Labourers (Ireland) Order, made in pursuance of the Act, prescribes what persons shall be deemed to be eligible for such employment, and recognises as eligible persons other than those who may be Fellows, Members, etc., of any recognised professional association or institute of architects.

The Local Government Board hold, and the Chief Secretary regards their view as reasonable, that the work of an architect in connexion with schemes under the Labourers' Act does not require specialised knowledge. Their experience has shown that excellent work in connexion with such schemes has been done at a moderate cost by men who did not claim in any way to be professional architects. The rule in question was accordingly so framed as not to apply to professional men alone, but merely to secure that the persons appointed should be thoroughly competent to carry out the work which devolves upon an architect in connexion with labourers' schemes.

The Local Government Board inform the Chief Secretary that they know of no case in which a Rural District Council has experienced any difficulty in obtaining competent persons who are willing to carry out the work at the rate of remuneration laid down by the rules. The Board are satisfied that many highly-qualified men have applied to Rural District Councils for employment at less than the maximum fees fixed in the Order. They are of opinion that it would be invidious to give the names of any such persons, and I am to add that it is quite possible that these applicants are not amongst the members of the Irish Institute of Architects.

W. R. DAVIES.

James H. Webb, Esq."

GENERAL NEWS.

The British Museum.

Sir Sidney Colvin, who has for so many years filled with distinction the post of Keeper of the Prints and Drawings in the British Museum, is about to retire from the public service.

Romano-British Sculptures.

Early application should be made to the Secretary of the Society for the Promotion of Roman Studies, at No. 19, Bloomsbury-square, W.C., for specimens of the casts of Romano-British sculpture which are now in course of being issued by the Society purely in the interests of education and archæological study and not as a commercial venture.

London University Site.

At a meeting of the Senate of the University of London, held on the 30th ult., the following resolution was carried:—"That the Senate welcome the efforts of Lord Haldane and of other friends of University education in London to raise funds towards the present and future needs of the University, and have referred to a Special Committee the consideration of the most suitable site for the University. A Committee, consisting of thirteen members, in addition to the three official members was appointed to consider and report on the question of an adequate site for the headquarters of the University.

Photographic Survey and Record of Surrey.

From the report of the Council of the Photographic Survey and Record of Surrey for 1911 we learn that during the past year 296 prints have been received as follows:—From seventeen Survey members, 267; from nineteen non-members, 28; from one professional photographer, 1; total, 296. The records received are classified as follows:—Architecture, 143; art and literature, 74; anthropology and antiquities, 20; natural history, 6; topography and passing events, 53; total, 296. Total brought forward from last report, 4,775. Grand total, 5,071. Six hundred and sixty-four lantern slides have been received during the past year, making a total to date of 1,122. The prints contributed to section of architecture during the year number 143. About one-half of these are of Godalming, Guildford, Eashing, and the immediate neighbourhood of these places. Prints have also been received of Bletchingley, Warlingham, Kenley, Sanderstead, Ockley, Capel, Wonersh, Shere, Chiddingfold, Mickleham, Limpsfield, Merstham, Reigate, Redhill, Earlswood, Ewell, Merton, Walton-on-the-Hill, and Farnham. Not so many details of churches have been contributed as in many former years, but more views of old houses and inns. There are still many churches in Surrey of which details of interiors would be useful. Two records of Wattlehurst Farm, at Ockley, may be mentioned as of more than passing interest. The name denotes the age and construction of this house. Interesting also are several views of old cottages in and around Godalming, and a view of the Crown Inn, Chiddingfold, said to date from 1,350. Among prints which have been added as a result of the Richmond excursion are views of The Trumpeting House, Queensbury House, and Asgill House (these three houses now standing upon the grounds and site of Richmond Palace); also views of Petersham Lodge and Petersham House. The Old Watch House, Ewell, is an interesting record, while an old house in the borough of Farnham, formerly known as the "Goat's Head," is an addition to the collection. This house has been carefully restored, and now exists as a perfect example of a XVIth-century house; there are evidences of a much earlier house, probably XIVth or XVth century. Four examples of Eashing Bridge, one of the most picturesque in Surrey, have been sent in by a member. It may be mentioned that this bridge is now under the care of the Society for the Protection of Ancient Buildings.

Skyscrapers in New York.

The British Consul-General in America, in a report just issued, refers to the scarcity of land in New York consequent upon the city being built upon a long narrow promontory and the building of sky-scrapers as a result. He says: "Land, therefore, which under normal circumstances could only give home or office room to, say, 200 or 300, now gives room to 10,000 or even 14,000. The extra cost in building is more than covered by the increased rates asked and obtained. Sky-scrapers are gradually moving northward and are increasing in numbers in the south, until in the future it is to be anticipated that New York will be a city of sky-scrapers. What will happen then is an interesting subject for speculation. To-day, forming, as they do, a sort of vacuum into which hundreds of thousands of human beings are projected every day at about the same hour, and from which they are ejected every morning, also in crowds, the sky-scrapers have paralysed all efforts to relieve traffic congestion in New York.

"New roads, ferries, railways, subways, and elevated tracks have been made, but as fast as they are completed the growing traffic overtakes their carrying powers and the congestion remains as bad as ever. The making of new ways of communication is limited, the sky-scraper extension is, for the time, unlimited, and therefore it would seem as if the congestion of traffic must become greater than ever, the supply of passengers always exceeding the means of communication. The day apparently must come, and before many years are past, when the sky-scrapers have brought the city to an impasse, when millions will be working where thousands were intended to work, where rates have risen to such a figure that they cannot profitably be made, and when people will begin to find it necessary to carry on their business more chiefly in places situated not on Manhattan Island."—*Westminster Gazette.*

CORRESPONDENCE.

Timber Specifications.

SIR,—It seems to be a general opinion that architects' specifications for the timber used in construction should be brought more "up to date." With this object, I should be obliged if you will insert in your valuable paper the short specification which I enclose, and invite comments thereon for the benefit of all concerned.

A READER.

[The following is the specification referred to. We should be glad to receive the opinions of our readers upon it.—ED.]

"The deals and timber for carpenters' work or carcassing to be as follows:—Sizes 12 in. by 4 in. and under to be sound, bright, square-edged Baltic or White Sea, red or yellow, and larger sizes to be sawn from White Sea larch of best quality baulk timber. The roof boarding and rough boarding in roof gangways to be second quality "Swedish" or second "Finish."

The flooring, where of deal, to be extra first or first quality Swedish yellow. Firsts which do not represent the highest grade—*i.e.*, which have an extra first shipped above them—will not be accepted.

The 1¼-in. flooring on first floor, where of pitch-pine, to be "prime" or "selected prime," free from knots or sap.

The wood for joinery (where not oak) to be Baltic or White Sea, red or yellow, selected from the best quality White Sea or best quality Swedish only. No nominal seconds nor any selection therefrom to be used.

All the panels of doors (which are not of oak) to be Canadian yellow pine, quite free from knots, or American whitewood of similar quality.

All wood to be in long lengths, free from open shakes, large loose or dead knots, or more than a small proportion of perfectly bright sap, and to be thoroughly seasoned. The admissibility of small shakes, knots, and a modicum of bright sap will be considered in relation to the position of such defects and their effect upon the visible finished work."

EDITORIAL SUMMARY.

The leading article deals with the Institute Elections and the Compromise.

In "Notes" columns (p. 657) appear comments on: "Architects and the Corporate Sense"; "Regent's Quadrant"; "Civic Responsibilities"; "The Clergy and Architecture"; "Survey of the Memorials of Greater London."

A meeting of the Royal Institute of British Architects was held on Monday, when Mr. William Woodward read a paper on "The Responsibilities of Architects and the Case of Minter *v.* Waldstein" (see p. 658).

A report of the meeting of the Church Building Society is given on p. 660. A short paper read by Mr. W. Tapper is given in the report.

A paper entitled "Architects and the Corporate Sense," read before the Transvaal Institute of Architects, is given on p. 661.

Some remarks by the new Slade Professor of Art at Cambridge, Mr. E. S. Prior, appear on p. 662, under the title, "The Study of Art."

The annual meeting of the Surveyors' Institution took place on Monday (see p. 663).

In Correspondence column (p. 665) is a letter upon "Timber Specifications."

The Monthly Illustrated Review of Civic Design (p. 667) includes: "The Royal Visit to India"; "A Suggested Whitehall Improvement"; "A Town-Planning Conference"; "Housing Reform"; and Notes.

The Building Trade Section (p. 672) includes: "The Study of Timber"; "Concrete-Mixers"; "Projected New Buildings in the Provinces," etc.

Book notices (p. 675) include: "Byways in British Archæology"; "Amateur Joinery in the Home"; "Pictures by Sir Henry Raeburn, R.A."; "The Parish of St. Giles-in-the-Fields."

MEETINGS.

FRIDAY, JUNE 7.

The Institution of Water Engineers.—Summer general meeting, Cheltenham.

The Institution of Municipal and County Engineers.—Scottish district meeting, Albert Hall, Stirling.

SATURDAY, JUNE 8.

The Institution of Water Engineers.—Summer general meeting, Cheltenham.

The Institution of Municipal and County Engineers.—Scottish district meeting, Albert Hall, Stirling.

Edinburgh Architectural Association.—Visit to Yester House and Castle.

MONDAY, JUNE 10.

Royal Institute of British Architects.—The fifteenth general meeting (business). (1) To receive the Report of the Scrutineers appointed to direct the election of the Council, Standing Committees, etc., for the year of office 1911-1912. (2) To proceed with the election of candidates for membership under By-laws 8 and 9. (3) notices of motion: Mr. Sydney Perks, F.S.A., to move "That a full and proper Report of the debate at the annual general meeting on May 6 with reference to St. Paul's Bridge be printed in the *Journal*." Mr. W. R. Davidge to move "That, having regard to the report of the Honorary Auditors for 1911 and to the state of the Institute finances, it is desirable, in the opinion of this meeting, that a Committee should forthwith be appointed with power to inquire generally into the finances of the Institute and all matters relating thereto. The Committee to consist of three members of the Council and three members of the general body, with power to add to their number; the Committee to have access to all documents and the services of all officers and advisers of the R.I.B.A.; to make any inquiries they may deem advisable, and to report in writing, with any recommendations, to the Council of the Royal Institute; the Report to be issued with or printed in the *Journal* and submitted for discussion at a business or general meeting of the Institute." 8 p.m.

The Incorporated Clerks of Works' Association (Carpenters' Hall London-wall).—Paper by Mr. H. Goodwin Robinson on "Up-to-Date Methods of Waterproofing and Roofing." 8 p.m.

THURSDAY, JUNE 13.

Society of Antiquaries.—8.30 p.m.

BUTTERWORTH'S WORKMEN'S COMPENSATION CASES. (London: Butterworth & Co.)

COMPETITION NEWS.

Whiteley Park, Surrey.

We are informed that in addition to the award to Mr. R. Frank Atkinson, F.R.I.B.A., second and third premiums have been awarded respectively to Messrs. Collcutt & Hamp, 36, Bloomsbury-square; and to Professor S. D. Adshead F.R.I.B.A., 46, Great Russell-street, London.

University College, Dublin.

Mr. Henry T. Hare, F.R.I.B.A., is the assessor in the competition, limited to architects living and practising in Ireland, for the proposed new buildings for University College, Dublin.

Whitley-road Primitive Methodist Church, Eastbourne.

The competition recently held for this church has been settled in favour of Messrs. George Baines & Son, 5, Clement's Inn, Strand, W.C., who have been appointed architects for the work. The estimated cost of the first portion of the scheme is 2,500*l.*

Workmen's Cottages, Rhos.

The competition for workmen's cottages, Rhos, has been decided as follows:—Mr. J. D. Aifon Jones, 140, Calabria-road, Highbury, London, N., and Mr. T. Vickars Henshaw, 44, Turret-road, Liscard, Cheshire, equal first; and Mr. E. W. Stubbs, Gravshott, Marlborough-road, South Croydon, S.E., second.

Welsh National Memorial Sanatoria.

With reference to our note last week (p. 634), in which we warned intending competitors that no professional assessor had been appointed, the Secretary writes that "the Committee do not desire architects to submit anything in the nature of elaborate plans, but merely what are generally known as pencil sketches, giving a rough outline of what the architect would suggest were he invited to prepare detailed plans. Subsequently, the Committee hope to select not more than six architects to submit competitive designs for the King Edward VII. Welsh National Memorial. In the selection of these gentlemen, the Committee will be to some extent guided by the pencil sketch sent in, and the details accompanying it, together with the experience which the architect may already have had in similar work. Although the 'particulars' sent out contain a mass of details, the important paragraph therein, so far as the present preliminary proceedings are concerned, is the following:—'Sketch plans should be accompanied by a report giving: (*a*) A preliminary estimate of the cost of erection; (*b*) a short explanation of the sketch plans; (*c*) particulars of other buildings, especially sanatoria and hospitals erected in accordance with plans prepared by the architect concerned and under his supervision.' The final selection of the completed plans sent in by the selected architects will be made by the Committee under the guidance of an experienced assessor.

Mural Decorations, Crosby Hall.

The awards in connexion with the various competitions initiated by the Mural Decoration Committee will be announced during the exhibition of designs now to be seen at Crosby Hall, Cheyne-walk. In a later issue full reference will be made to the individual works; meanwhile it may be said that the exhibition is well worth a visit. Apart from the competitive designs, there are works by Mr. John S. Sargent, R.A., Mr. Strang, Mr. Tonks, Miss McNaught, Mr. L. McD. Gill, and other artists.

Reigate Lodge Estate.

The Corporation of the Borough of Reigate invite competitive plans and schemes from architects, surveyors, and others for the laying-out and developing about 112 acres of the Reigate Lodge Estate. Premiums of thirty guineas and ten guineas are offered. A "duly-qualified assessor" is mentioned in the conditions, but his name has not been announced.

Competition Etiquette.

Mr. Henry W. Coussens, A.R.I.B.A., addresses a letter to the *Journal* of the Royal Institute of British Architects, from which we extract the following paragraph:—"In the *Kalendar* there are given the regulations governing architectural competitions, and, as certain of these are stated to be 'essential,' one therefore presumes they must be complied with by promoters before members of the Institute can be allowed to compete. These regulations can be read by all, and are clear enough to be understood by all. In any public competition, therefore, where the conditions of the promoters do not comply with these regulations, surely all members of the Institute should refrain from drawing even so much as a line until such time as the conditions are revised, and certainly in any negotiations that may be carried on with a view to such revision one would expect the Institute to insist that the necessary revision should be made in reasonable time, and thus enable all members to compete who may desire to do so."

King's Heath Baths Competition, Birmingham.

It is stated in the *Journal* of the Royal Institute of British Architects that the Council of the Birmingham Architectural Association have addressed a letter to the promoters of this competition objecting to Clause 4 of the conditions, which reserves to the promoters the right to appoint an independent assessor or assessors, and urging that the usual course followed in public competitions of importance should be observed—viz., that the President of the Royal Institute of British Architects be requested to nominate an assessor. Moreover, that the Council have circularised the members of their Association, asking them to abstain from competing until the offending clause has been amended.

ILLUSTRATIONS.

Study for a Royal Memorial.

THIS study was prepared at a time when the position of the Edward VII. Memorial was not decided on, in order to show the possibilities of Parliament-square as a site, and as a suggestion for a dignified treatment enhancing the surroundings and adequately expressing the characteristic activities of the deceased monarch. The drawing is shown at the present Royal Academy Exhibition.

A Suggestion for Whitehall.

DEVELOPMENTS in the Whitehall district will be proposed shortly, and in our article beginning on p. 668, and with Mr. Berrington's drawing, we anticipate the problem, offering a solution which we hope will be worthy of consideration by the authorities.

The Royal Visit to India.

REFERENCE is made in the article beginning on p. 667 to the temporary buildings and decorations erected on the occasion of the visit of the King and Queen to India. On one of our plates the Reception Pavilion, Bombay, and a Processional Road are illustrated.

FIFTY YEARS AGO.

From the *Builder* of June 7, 1862.

The International Exhibition.

MUCH has been said about the mercenary character of the present Exhibition; and there can be no doubt that the arrangements on this score have opened up opportunities to a whole host of exhibitors, who have never had any other object in view than making the present Exhibition a mere medium of advertisement. Unless under very stringent regulations, this was naturally to be expected in the inferior branches of manufacture. But one did not expect to see the mere trading spirit invade the region of the highest branches of the fine arts. Nevertheless it has done so. Here are models of statues, only plaster models, exhibited for the mere purpose of getting orders. M. B. exhibits several patterns in plaster in this way, ticketed with the price for which they can be had done in marble; another price for bronze; a lower price for the same thing, half-size, and so on. This is really too bad. What should we think of one of our leading painters if he had exhibited an oil sketch ticketed after this fashion:—Mr. P. Q. will execute this subject, size 4 ft. by 3 ft., in his best style, for 200*l.*; less highly finished, for 150*l.*; and half-size for one hundred guineas?

PROCESSIONAL ROAD.

DECORATIONS ON THE OCCASION OF THE ROYAL VISIT TO INDIA.—Mr. G. Wittet, Architect.

MONTHLY REVIEW of CIVIC DESIGN.

Reception Pavilion.

THE ROYAL VISIT TO INDIA:

CIVIC DECORATIONS OF BOMBAY.

THE preparations for the reception of their Imperial Majesties in Bombay were divided into two sections—first, ose undertaken by the Government, and, ond, those undertaken by the citizens of mbay. The Government part consisted of arranging for the landing and reception at the Apollo Bunder, Fig. 1, and the presentation of the address from the Corporation, while the citizens undertook the decoration of the route of the procession through Bombay. Mr. Wittet, Consulting Architect to the Government, prepared the designs for the buildings and general arrangements on the Bunder, in consultation with His Excellency Sir George Clarke, Governor of Bombay, who took a keen personal interest in the work from the outset.

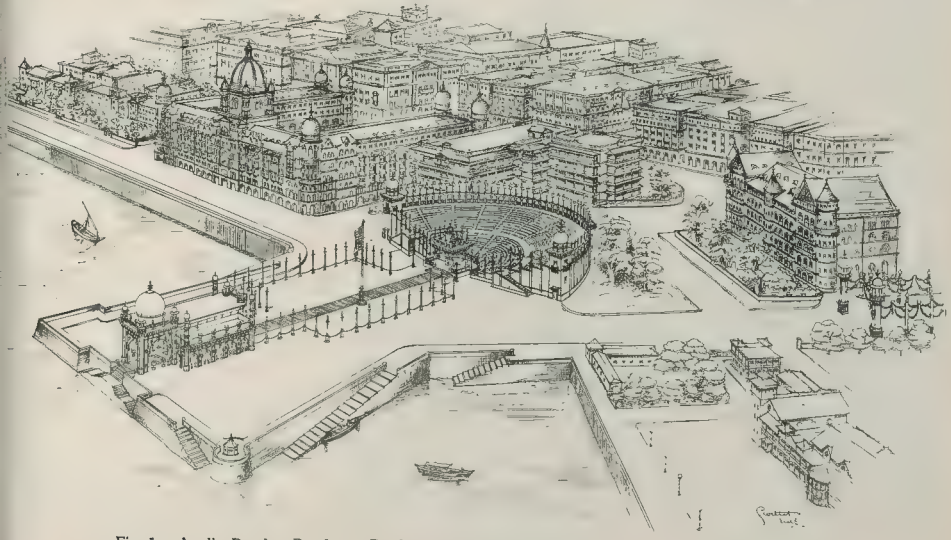

Fig. 1. Apollo Bunder, Bombay: Pavilion and Amphitheatre for the Reception of their Majesties.

Mr. G. Wittet, Architect.

Fig. 2. The Parsee Arch.

At the landing steps a reception pavilion was erected (p. 667 and plate), Saracenic in style, consisting of a domed porch, a central nave, and two side aisles, where the chiefs and high officials were grouped. The structure was white throughout, with the mouldings and ornament picked out in gold. The open space behind the pavilion was lined out with white Saracenic pillars of reinforced concrete surmounted by golden lions enclosing the guard of honour. The enclosed space was covered with white sand, with the red carpet, 15 ft. wide, stretching from the pavilion to the Royal daïs in front of the amphitheatre.

The daïs consisted of a platform 2 ft. 6 in. high, with a canopy over the central portion covered with Royal blue silk surmounted by the Imperial Crown in gold. Round the pierced work parapet of the canopy were twelve banner poles bearing emblematical flags of the Empire.

Two thrones of Indian design and workmanship were placed under the canopy for their Majesties. They were of teak wood entirely gilded; the seats and backs were of cloth of gold, specially woven in Surat with a pattern containing the Royal monograms.

In front of the daïs a great amphitheatre was erected to seat 3,000 people; the walling and towers were white relieved with gold, and the seating and steps were covered with cloth dyed a soft green tone.

The top stage of the amphitheatre was surrounded with an arcade having a mast at each pier carrying a banner and rich flower festoons between.

All the arches of the pavilion and amphitheatre were festooned with garlands and baskets of natural flowers. The buildings were lined out with rose-pink electric lamps and the central open space ringed with amber.

When the Committee of Citizens came to consider the question of street decorations it was thought advisable to endeavour to carry the note which had been begun at the Bunder throughout, and Mr. Wittet was asked to prepare a scheme for the general decorations of the city.

In the scheme as carried out the different leading communities in the city were represented. The road leading from the Bunder was lined out with slender white minarets with gold domes linked together with festoons of leaves and flowers (see plate). These garlands were the only portion of the decorations obtained from home. They retained their bright colours for about a week; after that the Indian sun and dust were too much for them. The minarets were spaced 30 ft. apart, and each bore a 9-ft. banner with an Indian device. At the start of the road were two large minarets with balconies and cupolas, and the vista led up to a great Saracenic arch. A number of roads meet and cross beyond this arch, and that portion was left clear, the decorative treatment again starting where the procession entered Hornby-road. A long avenue of pillars led up to the Parsee arch, a massive structure modelled on restorations of old Assyrian work (Fig. 2). The upper gallery was draped in purple velvet, the main structure was white with green and gold decorations.

Beyond this the route passed between pillars of Hindu design, square on plan, and roofed with conical cupolas characteristic of Jain architecture gaily decorated in primary colours and surmounted with bannerettes. The pillars were in pairs, each bearing a golden elephant on a bracket to take the festoons across the street. At the Municipal Buildings an arch of Renaissance character was erected bearing the arms of the city. At the entrance to the native town four pairs of Hindu pillars were erected. In the narrow streets no decorations were attempted until the entrance to the Mohammedans' quarter was reached. Here four minarets, 50 ft. high, were erected (Fig. 3), with a canopy of green silk with tinsel decorations suspended in the centre. Where the route started to return eight minarets formed a circle round the cross roads linked with banners and festoons. The broad new Sandhurst-road, which the Improvement Trusts have opened from east to west, was treated with minarets, banners, and festoons leading up to the cotton arch, a structure composed entirely of cotton bales and loose cotton to the value of about 12,000*l*. This curious erection, typifying Bombay's chief industry, was not unpleasing from a decorative point of view. Beyond this the treatment of pillars and lining out minarets was carried on with only one variation in the Renaissance pair representing Goa. The long avenue of Queen's-road, where fine trees meet across, was left untouched, the decorative scheme beginning again at the Secretariat in Mayo-road, and sweeping round to the arch leading to the Bunder.

A SUGGESTED WHITEHALL IMPROVEMENT.

THE general growth of the country and of the functions which the State is called upon to perform leads to an inevitable increase in the number of buildings necessary to house the ever-increasing array of Government officials.

Tradition and convenience alike have made Whitehall the centre of Government administration, and offices for this purpose have gradually spread along the western side of the street from Spring-gardens to Parliament-square. This side being now fully occupied, any further space required must be found on the eastern side, where a beginning has been made by the erection of the War Office and the Office for the Commissioner of Woods and Forests.

Extending from Horse Guards-avenue to Westminster Bridge, between Whitehall and the Embankment, is a strip of land the whole of which will probably be acquired in time for Government buildings. Already the northern end adjoining Horse Guards-avenue has, we understand, been acquired, on which a building is to be placed which will lead to the demolition of the old houses in Whitehall-gardens and seriously interfere with the present open space at the back of Gwydyr House.

As it is apparent that the building for which powers are now being sought from Parliament will not be the last in this neighbourhood it would seem more reasonable to look ahead and to make some general scheme embodying the whole of the land between Whitehall and the river, of which the proposed building would form the first instalment, rather than to proceed on the piecemeal method, which has been responsible for so many of our blunders in the past.

In this connexion we naturally recall Barry's fine scheme for the western side of Whitehall, and we cannot help wondering whether a similar scheme produced to-day for the eastern side would have any better chance of being carried out in its entirety. Considering the great advance we have made in recent years, there is surely some ground for hope that public interest may be aroused and that the official minds, who, all unknown to us, seem to sway our destinies in these matters, may be induced to take a wider view of their responsibilities and to realise the effect of their present actions upon the future destiny of London.

It is evident that no treatment of the northern part of this site can be considered adequate unless it preserves the open space in Whitehall-gardens and at the same time provides an adequate architectural finish and frontage line to Whitehall, while taking into consideration any traffic improvement which may be involved; and the general improvement of Whitehall and the district as a whole.

It is suggested that the problem might be considerably simplified and these advantages obtained by creating a new street, as shown in the accompanying plan (page 670) and view (see plate) looking up Whitehall.

This would have the added advantage of opening up a new vista in Whitehall and of providing a site for a monument on the axis of Downing-street and an open vista to the river.

The plan shows the whole of the land between Whitehall and the Embankment devoted to Government buildings, the lay-out of which would be to some extent governed by the necessity of respecting the old Banqueting Hall and New Scotland-yard.

The new street would take up a certain amount of space which might otherwise be used for the new buildings, but to compensate for this projections are shown in the gardens of the Embankment. It is felt that air space is of more value in Whitehall than on the Embankment, where the whole width of the river is available, and that such projections would relieve the monotony and cliff-like appearance of any range of high buildings continuing the frontage line and general height of Whitehall-court and the National Liberal Club.

But, whatever value there may be in this suggestion, it cannot be too strongly urged that no definite steps should be taken towards the erection of a new building without giving due consideration to all the possibilities involved.

A TOWN-PLANNING CONFERENCE.

A NATIONAL Town-Planning Conference, attended by representatives of nearly all local authorities in the North of England and the Midlands, opened in the Association Hall, Manchester, on the 22nd ult. It was convened by the National Advisory Town-Planning Committee. Mr. Alderman W. Thompson, of Richmond, Chairman of the National Housing and Town-Planning Council, presided.

The Chairman (we quote from the *Manchester Guardian*) explained that the Conference had been called to consider how best to put into operation an Act of Parliament which would procure better sanitary conditions and greater amenities for dwellings in the large industrial areas in the North and Midlands of England. In his opinion this was a matter of life and death. In Lancashire alone there were 81,000 deaths every year—a quarter of which at least were preventable—and a corrected death-rate of 19·5 per thousand. In Westmorland the death-rate was 11 per thousand. Why should there be such a difference? It might be said the cause was industrial, but the figures did not bear that out, for there were parts of Lancashire and of Manchester and Liverpool more healthy than Westmorland. It was not the climate or the nature of the people's occupation; it was the condition of the dwellings and the surroundings of the dwellings of the people.

Mr. Henry R. Aldridge, the Secretary, presented a report on the first stage of a town planning scheme, indicating the character and type of the land to be included. One encouraging feature of the movement, he said, was the enlightened attitude of many large landowners. At Sheffield, for instance, owners came forward and even suggested that instead of twenty houses being allotted to the acre there should be only twelve. They were beginning to recognise that as a result of a better spreading of the population much more of their land was likely to come into use and that this was good business.

Replying to a question as to the stage at which jerry-building could be stopped under a scheme, the Chairman explained that once a notice of such a scheme had been given all jerry-building was done at owner's risk. No compensation was payable after formal notice had been given of an application to the Local Government Board for authority to prepare a scheme.

A representative of Great Crosby mentioning that after spending 200*l.* in preparations the authorities of that district had abandoned its town-planning scheme,

The Chairman said that from every point of view this was a "penny-wise-and-pound-foolish" policy. In contrast, he pointed out that at Ruislip they had limited the houses to eight, six, and four to the acre. In only one district were there as many as twelve to the acre, and if Ruislip dropped its scheme to-day they would be at least 40,000*l.* in pocket. They had secured acres and acres of open spaces for nothing. In one instance an American firm of land exploiters had been only too glad to come forward and give 16 acres. A sum of 100*l.* spent to-day in a town-planning scheme meant 100,000*l.* saved in the future.

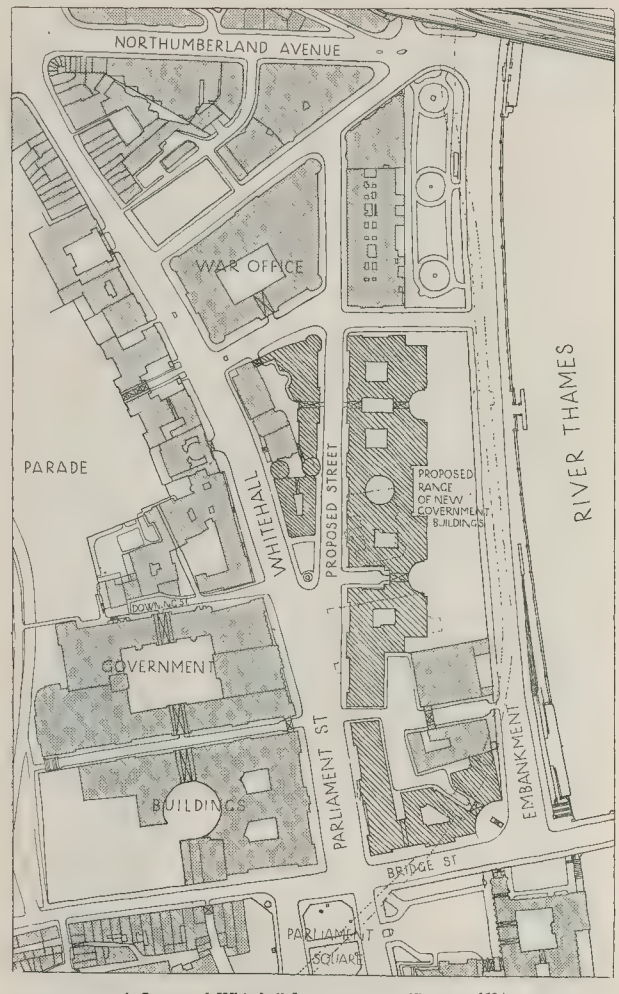
A representative of Alderley Edge asked for an expression of opinion as to the advisability of that district, and others of its kind, adopting a town-planning scheme. He pointed out that there were some hundreds of acres of undeveloped land, and that the rent of the houses varied as much as from 3*s.* a week to 200*l.* a year.

The Chairman replied that he would certainly say they should waste no time in adopting a scheme, ring round the whole district, and then indicate to the Local Government Board that there was no intention of dealing for the time being with the thickly populated portion.

Mr. Harold Shawcross submitted a report on the second stage of a town-planning scheme, dealing largely with relaxations of by-laws and road-making and other plans. He emphasised the need of following up such schemes by careful oversight, with the object of obviating nuisances such as the erection of ugly tin and wooden structures in back gardens and open spaces; and suggested that in South-east Lancashire there should be a scheme to cover the whole of the undeveloped land.

Mr. Alderman W. Rhodes (Chesterfield), in a paper on the construction of roads under town-planning schemes, suggested that the heavier types of traffic-bearing roads were not needed in residential districts and that in the event of existing industrial conditions, or future developments necessitating heavier roads, the extra cost of them should not be borne by the cottagers, but by the community at large in the town for whose benefit they were intended.

On the second day of the Conference,



Mr. T. C. Horsfall, in opening a discussion on the need for economy in road-making in town-planning schemes, said that in his opinion the civilised world knew no greater curse than the unnecessarily wide road. There was more misery produced by it in German cities than anything we experienced in our large towns. It was stated that in Berlin there were over 600,000 people living in dwellings of one or two rooms, in each of which rooms there were from five to thirteen people. And those workmen were not the miserably poor people found in the worst slums of our large towns. It was calculated that as a result of their wide streets, necessitating tall houses and very high rents, the Germans were at present paying sixty millions sterling more for their housing accommodation than English people of the same class were paying. It was not correct to say that town-planners were proposing to give a poorer type of street. What they really proposed to do was to give a type of road which at present only the rich man could enjoy—a park road to the park cottage.

Mr. Harold Shawcross emphasised the importance of radial roads. In many Lancashire and Yorkshire towns, he said, the roads on the outskirts were so badly planned that it was frequently necessary to travel 2 and 3 miles to reach a point a mile or two away. This not only caused much loss of time, but led to much unnecessary waste of road surface and work and cost of repair.

Mr. Arthur Bowes, Surveyor to the Newton-in-Makerfield District Council, presented a paper in which he dealt with the importance of prompt

Fig. 3. Minarets, 50 ft. high, and Canopy. (*See page* 668.)

A Suggested Whitehall Improvement. (*See page* 668.)

action on the part of all local authorities in the allocation of roads, so as to avoid having to pay large sums for compensation when the time came for the roads to be actually constructed. The cost of getting rid of the faults of the past in this respect were four times as great as the actual road-making. Moreover, in allocating the roads local authorities improved an estate and were entitled to half the betterment, which went a long way towards paying the cost of the road-making.

Mr. H. Lloyd Parry, Town Clerk of Exeter, contributed a paper on the cost to local authorities of town-planning schemes. Basing his figures on those of nine selected schemes, he estimated that the cost of preparing a scheme was from 100*l.* to 200*l.* for an area under 1,000 acres and 100*l.* per 1,000 acres, or 2*s.* an acre over and above that area. This excluded an expenditure in fees or salary for a town-planning engineer or other expert adviser, and was referable only to a scheme for town extension over an undeveloped area to which the action of local authorities under the Housing and Town Planning Act was mainly limited.

The Chairman, in introducing a discussion on standards of limitation of the number of houses per acre, announced that the Birmingham authorities, by ninety-one votes to three, had decided that in the important scheme for Quinton and Harborne, covering an area of four figures, the average number of houses per acre was to be no more than twelve.

Mr. George Cadbury, of Birmingham, outlined a scheme under which, he said, the working man could be given 60 per cent. more land at a cost of only a penny a week more ground rent. Experiments in Bournville indicated that the value of the small garden thus provided amounted to at least a shilling a week. Working men would be only too glad to get such gardens at their doors, seeing that the residents of some of the worst slums in Birmingham would walk 4 miles, before or after work, many times a week in order to cultivate small allotments.

Mr. E. M. Gibbs, a former President of the Sheffield Society of Architects, read a paper in which he gave some tables of cost showing that landowners could afford, in town-planning conditions, to give four times the extent of land for double the ground rent. Where the ground rent would be 30*s.* with houses numbering forty to the acre, it would be 40*s.* with twenty houses and 63*s.* with ten houses to the acre.

Mr. Pemberton, of Warrington, drew attention to the large number of people whose income did not exceed 1*l.* a week, and appealed for more attention to be devoted towards meeting their housing requirements.

Mr. Henry R. Aldridge explained that Conferences in Denmark, Holland, Belgium, and France which he had attended had come to the conclusion that there were only two alternatives in dealing with this problem of the poorest. Either the community must prevail upon employers to pay reasonable wages sufficient to enable men to live decently and well, or the community must be prepared to provide decent housing accommodation for such people at a loss. The latter was probably the alternative this country would eventually adopt. We were spending a million sterling a year in building sanatoria in which men would be patched up for a few months and then sent back into the very slums in which they contracted the terrible disease of consumption.

Mr. F. W. Platt, Building Surveyor to the Salford Borough Council, in a paper on industrial development advocated more co-operation between adjoining local authorities in order that the residential areas in town-planning schemes should adjoin other residential areas, and not be spoiled by manufacturing areas being run up against them.

A resolution was adopted requesting the Local Government Board to dispense with the serving of notices upon each owner of property at the first stage of a town-planning scheme, and to substitute the giving of notice by advertisements in newspapers, or by posting notices in the districts included in the scheme, notices for the second stage of the scheme to be served as provided by the Act.

It was announced that a series of "municipal visits" to examples of English town-planning and kindred schemes was being organised for July 5 and the following eight days. The places to be visited included the Liverpool town-planning schemes and housing of the poorest, the garden village of Port Sunlight, York's garden suburb of Earswick, Birmingham's town-planning schemes, Bournville, the London County Council, and the Sutton Trust housing schemes, the Rowton Lodging-houses, Hampstead, and the first garden city of Letchworth.

HOUSING REFORM.

MR. EUGENE WASON presided recently at a sitting of the Grand Committee of the House of Commons to which had been referred consideration of the Bill introduced by Sir Arthur Boscawen to provide for the better application and enforcement of the Housing of the Working Classes Acts, and to amend the Small Dwellings Acquisition Act, 1899. Clause 6 relates to the relaxation of by-laws. At the previous sitting Mr. Herbert Lewis (Parliamentary Secretary to the Local Government Board) had moved to insert at the beginning of the clause the following:—"The provisions of any by-laws made by any local authority under sect. 157 of the Public Health Act, 1875, as amended by any other Act, with respect to new buildings or new streets, including provisions as to the giving of notices and the deposit of plans and sections, and any provision in any local Act dealing with the construction of new buildings and the laying-out of new streets, and any by-laws made with respect to new buildings or new streets under any local Act shall not apply in the case of any new buildings being constructed or new streets laid out."

Mr. C. Bathurst moved to amend the amendment with the object of ensuring specifically that the clause should apply to rural districts. The question of by-laws was more serious in many country districts than in urban localities. The by-laws in rural areas were often a greater restriction on the erection of much-desired cottages than any other single factor.

Mr. Burns (President of the Local Government Board) said that the clause applied to both rural and urban districts. He promised to look into the matter and on the Report stage to make it absolutely clear, if it was not already clear. On this understanding Mr. C. Bathurst did not press his proposal.

Mr. Booth then moved to delete the words "new buildings or" at the commencement of Mr. Lewis's proposal. He wished to have the views of the Local Government Board with regard to the proposed weakening of by-laws and undermining of responsibilities of local authorities. The pressure of the Local Government Board hitherto had been to make by-laws more stringent. Were the Local Government Board backsliding?

Mr. Burns said that until this Bill was brought forward it was generally assumed that Clause 4

f the Housing and Town Planning Act of 909 met the case of any unreasonable impedi- ent or obstruction to the building of houses or the working classes due to by-laws. But the romoters of the Bill thought that the power in hat clause was not sufficient to meet all the oints raised since the passing of the Act.

Mr. Jonathan Samuel said local authorities ere exacting in their by-laws because they new that when, in the past, by-laws were x any kind of house was built. Now it was roposed to enable local authorities to relax by- ws in regard to their own undertakings, but o insist on them in regard to the undertakings f local builders. The result would be that eryone who went in for the building of houses ould create an agitation and say: "Why hould I have to spend more than the local uthority? How can I compete with the cal authority?" Pressure would be brought n the members of local Councils in such a case, nd the members would not be able to resist it. he proposed power of relaxation would be ry dangerous. If relaxation was needed would be better for the Local Government oard to produce a new set of by-laws. Then eryone would know what he had to work to.

Sir Arthur Boscawen said our existing slums ere principally due to the fact that in the *azzez-faire* days of seventy or eighty years go anyone could build as he chose. To meet e condition of affairs the by-law system was nvented. But by-laws had been adopted in rtain places which had proved quite unsuitable the locality, and the cost of erecting work- en's dwellings had thereby been enhanced such an extent that it was impossible to them at a rent which the poorest could pay thout imposing a heavy charge on the rates. e wanted to cut that knot. Clause 44 of the t of 1909 helped to some extent, but it put e whole initiative on the Local Government oard to say whether there was an impediment not. Therefore he wanted a local authority have a right to say to the Local Government oard: "We want to supply dwellings, but e by-laws are such that we cannot do it rept at a loss, and therefore we come to n for a relaxation, subject to your approval, the by-laws." Anyone providing houses for e working classes should have the same laxation as local authorities. He welcomed e clause put down by the Government cause of the greater elasticity which it uld give.

Mr. Keir Hardie thought they were in danger ile attempting to meet one evil of creating other and even greater evil. The object emed to be to crowd more houses on the land an the present by-laws would allow.

Lord Henry Cavendish-Bentinck held that ne relaxation was absolutely necessary and was to be laid out on more enlightened es. There was no doubt that the present laws had resulted in overcrowding. Under e existing by-laws forty-five houses to the e could be erected. If, as he believed, amendment would allow an individual association to obtain some relaxation the ividual or association would be able to dimin- the number of houses per acre. The working n wanted a place in the sun, and that was at they were trying to give him.

Sir Randolf Baker said the only valuable ng left in the Bill was the power to alter laws, but if that power was only to go as as was stated in Mr. Lewis's amendment it uld not be sufficient.

Eventually the amendment of Mr. Booth s rejected by twenty-one votes against five.

Sir Randolf Baker next moved to add to Herbert Lewis's amendment "whether a private individual or private individuals order to supply a deficiency of working- ss dwellings in any locality." This would e the same power to a private individual Mr. Lewis's amendment would give to a l authority.

Mr. Rupert Gwynne, in supporting the amend- nt, pointed out that without the provision rate enterprise could not enjoy relaxation by-laws although the local authority might willing to relax them.

Mr. Wedgwood also supported the amend- nt. The present by-laws were issued twenty s ago, and they formed a sort of protective ff in favour of houses built under them. people who had erected houses under those laws—often spending more on the houses n was necessary—had a vested interest in the ation of the by-laws in order to prevent the petition of cheaper houses. They were now adopting a more free-trade view—trying to get more competition in the construction of houses. The present amendment would break down the existing tariff in favour of existing houses.

Lord Henry Cavendish-Bentinck declared that public utility societies had been very much hampered by the jealousy and obstruction of local authorities. He could not see why utility societies should not, with the consent of the Local Government Board, have the right to go ahead with their own plans. He suggested, therefore, that they should be included in the scope of Sir R. Baker's amendment.

Mr. Burns stated that the term "person or persons" would include societies and associations, and that term was therefore substituted in the amendment for the words "private individual or private individuals."

After further discussion Mr. Burns said that in the last ten years under existing by-laws and regulations there had been greater housebuilding for the poor, above all, for the working classes, than in any other country in the world. That was because the schemes had been in advance of the minimum insisted on by the by-laws and regulations of the Local Government Board and of the local authority. The existing by-laws permitted variation, novelty, and great elasticity in laying-out and in the construction of individual houses. Bureaucracy *in excelsis* was proposed. Many new officials would be needed at Whitehall. The effect of the proposal now before them would be increased taxation, endless delay, interference with local authorities, which those authorities would probably resent, and possibly an increase in the number of jerry-builders in local authorities, who might divert this provision to their particular ends in a way which was not now seen. He admitted that Clause 44 of the Act of 1909 was not elastic enough, and he was willing to give exemptions to schemes brought forward by local authorities. There was some reason for giving exemptions to local authorities, because they might be satisfied that they complied with a minimum standard of construction, sanitation, and so forth, but that could not be guaranteed for schemes promoted by private individuals. The amendment if adopted would break down by its weight, its cost, and its delay. He would be false to his duty if he removed the protection afforded by the by-laws of good authorities which were standing up to the jerry-builder and to the man who wanted to create new slums. If the promoters of the Bill accepted the amendment unconditioned and unregulated by strong safeguards, they would defeat their own objects. All the slums of to-day belonged to the non-by-law period.

Sir Arthur Boscawen greatly regretted the non-possumus attitude of Mr. Burns. The objection of the right hon. gentleman was that the proposal would entail on the Local Government Board an enormous amount of cost and of work. Until they had an expert department at the Local Government Board they would never move on in the matter of housing. The chief reason the London County Council had not developed the Tottenham Estate better was the existence of the local by-laws. He supported the amendment.

After further discussion,

Mr. Burns said his position was that he was prepared to consider schemes and plans whether submitted by a local authority, a public utility association, or "a person or persons." He was prepared to give greater elasticity and wider exemptions than now, but he could not accept the amendment of Sir R. Baker.

The amendment was still under discussion when the Committee adjourned until June 6.—*The Morning Post.*

CIVIC DESIGN NOTES.

The Garden Cities and Town-Planning Association. A useful course of lectures on the various phases of town planning has been conducted by the Garden Cities and Town-Planning Association at their offices, 3, Gray's Inn-place since Easter. The last of the series was given by Mr. Raymond Unwin, F.R.I.B.A., his subject being "The Principles of Garden Cities and Garden Suburbs." The paper set out the advantages which may be derived from the Garden City method of lay-out, and the application of those principles to new and old towns. Mr. Unwin emphasised the necessity for keeping a belt of open space around the towns, and urged the federation of small towns, as suggested in Mr. Howard's first proposals. If it was desirable to limit Letchworth to 30,000, then it was still more important to secure belts of open space around our old over-grown towns. The federation of small towns would preserve the belt of land around each, and their combined action would enable them to provide for educational, municipal, and other advantages not possible to the smaller communities. The old towns had open belts to protect them from their enemies; surely it was worth while for the modern town to secure an open belt to protect it from slums, disease, and degeneration. Mr. Unwin dealt from the landowner's point of view with the limitation of the number of houses to the acre, showing how it would be to his advantage, because he would sell twice as much land for this purpose. The cost per plot of an acre of land was not the same thing as the cost of a slice of cake in proportion with the cake, because the slices made up the whole cake; but in cutting up the land large strips had to be taken out for roads, which represented the wastage which was eliminated by Garden City methods. With new tables and diagrams Mr. Unwin showed how his scheme would work out. He also dealt with the question of the selling of 2 acres of land instead of one, and what the owner could afford to sell his land at in that case, showing still further reductions in the cost of development. Another point which was strongly urged was the question of the limitation of the number of houses to the acre, the speaker appealing for a schedule rather than a hard-and-fast rule.

Chair of Town Planning for London. A scheme is now on foot, and is receiving the support of Mr. John Burns, Sir Aston Webb, Sir Philip Magnus, Sir William Collins, and Sir Henry Miers, for the establishment of a Chair of Town Planning at the University of London. It is interesting to note that the idea of a professorship originated with Mr. John Burns, who made the suggestion at the opening of the Town Planning Exhibition, held at Crosby Hall some time ago. Since then, Mr. Herbert Warren, of the Garden Cities and Town Planning Association, has been actively engaged in forming a committee consisting of people representing the different aspects of the question. The Association of Garden Cities, in furtherance of Mr. Burns's suggestion, has now decided to hold an experimental summer school—on university extension lines—of town planning at the Hampstead Garden Suburb during the first fortnight of August. At that school professional men will attend short courses of lectures and also practical demonstrations on how town planning should be carried out by some of the most eminent of English and foreign town planners.

Wandsworth Common Extension. Lord Meath has written to Mr. Edwin Evans, Chairman of the Committee for the Extension of Wandsworth Common by the acquisition of 20 acres of land, saying that he will bring the matter before the Metropolitan Gardens Association. Reckoning the 6,000*l.* which the Parks and Open Spaces Committee of the London County Council have decided to recommend as a grant, only 500*l.* is wanted to complete the fund.

Boys' Garden City, Woodford Bridge. The Boys' Garden City at Woodford Bridge, Essex, which is the latest development of Dr. Barnardo's Homes, was formally opened on the 23rd ult. by the Duchess of Albany.

Mr. W. Baker, addressing the company assembled in the marquee, remarked that already in the twelve detached houses which have been completed in the Garden City nearly 300 boys were accommodated, and money to defray the cost of three more houses which were being built had been provided.

The Duchess of Albany was conducted to the house which has been erected in memory of King Edward VII., and this, at the request of Mr. W. A. Pite, the architect who has designed all the houses in the Garden City, she opened and inspected. Her Royal Highness then visited the swimming-bath.

THE BUILDING TRADE.

CONCRETE-MIXERS:

THE SMITH MIXER.

THIS machine consists of a drum of double conical form, which can be tilted while it is being rotated, the general arrangement of the machine shown by Fig. 1.

Inside the drum are fixed blades in two series, one in each conical projection. The series of blades are disposed in opposite directions and overlap at the middle of the drum.

When the materials for concrete have been placed in the drum they are transferred from each end towards and past the centre alternately and at the same time turned over and over. This transfer of material is caused in part by the spirally arranged blades, and in part by the conical form of the drum. The effect is rapid and thorough mixing.

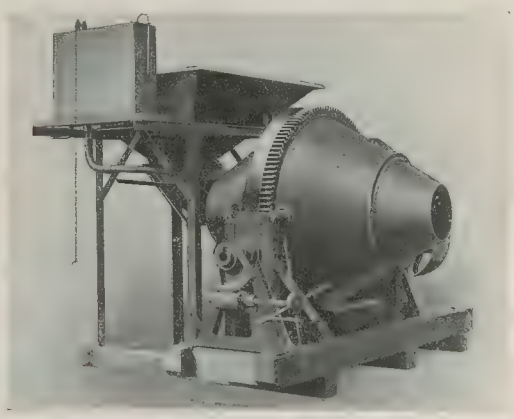


Fig. 1. Smith Mixer with Batch charging hopper.

The guiding and driving surfaces of the drum are on a single ring casting, and the driving gear is attached to a strong cast-iron frame.

Tilting can readily be performed by a hand-operated worm gear without stopping the action of the mixer. In this way the contents of the drum are quickly discharged, and it should be noted that very little power is required to tilt the drum, for the reason that the load is not lifted, but merely swung about its centre of gravity. The larger sizes of the Smith mixer can be supplied with power tilting apparatus providing for partial or complete discharge.

All drums are fitted with drip rings on the discharge end to prevent wet material from running down the cone and over the roller tracks, and the drums are lined at the middle where the large ends of the cones meet. The linings are made to standard size, and can easily be replaced when worn.

The mixer is supplied in the simple form illustrated, or combined with measuring bins, automatic water-tank, and other accessories, and arranged for driving by belt, steam engine, internal combustion engine, or electric motor

Fig. 2 shows a Smith mixing plant as arranged for the preparation of concrete on a large scale.

It is made in various sizes of from 6 cubic ft. to 62 cubic ft. capacity.

The patentees of this mixer are the T. L. Smith Company, of 11, Victoria-street, Westminster, for whom the machine is manufactured by Messrs. Stothert & Pitt, Ltd., of Bath.

BIDFORD-ON-AVON.

A memorial window has been placed in the parish church at Bidford, and is a three-light window in the south aisle, and has been filled in with stained glass, the subject being the Crucifixion. The window was designed and painted by Messrs. F. Holt & Co., of Warwick.

THE STUDY OF TIMBER.

AN interesting and valuable report on the study of timber and forest products in America has been presented to the Forestry Committee of the University of Cambridge by Mr. E. R. Burdon, M.A.,* arising out of a visit to the United States and Canada for the purpose of studying the research work and educational methods of the Forestry Departments and Forestry Schools in those countries in connexion with the study of timber and other forest products. The subject is of considerable importance, and for that reason we are quoting at some length from the admirable report by Mr. Burdon, only remarking that there is little doubt that the establishment of an institution which would assist the study of our wood-using industries would lead to the discovery of new applications for home-grown timbers, encourage afforestation, and benefit both growers and consumers.

According to the author, the most important research work on timber in the United States is that which is being carried on by the Branch of Products of the Forest Service. The main object of this branch is to develop more economical methods of utilising forest products generally, so as to eliminate the enormous waste which occurs not only in logging, but also in conversion into lumber and in manufacture. In pursuance of this object the Products Branch endeavours to organise systematic scientific research and to disseminate information regarding the mechanical, physical, and chemical properties of commercial woods and their products, the utilisation of forest products, the natural and artificial seasoning of wood, wood preservation, wood distillation, the production of paper pulp, naval stores, and other chemical products. It also compiles statistics of production, consumption, prices, and market conditions, investigates commercial methods of manufacture, of grading, and utilisation, and the possibilities of substitution of new species or other materials for woods which are becoming scarce, etc. The range of the investigations of the Products Branch covers every industry which is in any way dependent on the forest for its raw material.

The Products Laboratory is organised into eight technical sections for experimental research and one non-technical section, which attends to general maintenance.

The technical sections are as follows:—

(1) Timber Testing.
(2) Timber Physics.
(3) Wood Preservation.
(4) Wood Distillation.
(5) Pulp and Paper.
(6) Engineering (with Drafting-room).
(7) Chemistry.
(8) Pathology.

The wood-working shop is a carpenter's shop furnished with various machines for sawing, shaping, and dressing wood to the required sizes for experimental work. The shop opens conveniently into the timber-testing laboratory on one side, into the wood-preservation laboratory on the other, and into the yard at the back. The equipment includes circular and band saws suitable for different classes of work, a short log saw-mill and edger, machines for trimming, edging, planing and mortising, wood-turning lathe, work-bench, etc.

(1) Timber-Testing Department.

Here investigations are made into the mechanical properties of wood both before and after manufacture, or preservative treatment, or seasoning.

At present tests are being carried out on the different commercial woods of the United States with a view to determining their relative mechanical properties, *e.g.*, strength, toughness, hardness, etc. A point wherein these tests differ from those generally made by engineers

* Cambridge: At the University Press. Price 6d. net.

Fig. 2. Smith Concrete-Mixing Plant.

that the specimens are collected from the rest, and the history of each, the conditions soil and environment, etc., under which each as grown are known. The structure of each ecimen is noted from microscopic sections ade in another department, and as sufficient ta accumulate attempts will be made to rrelate the structure with the mechanical d physical properties. It is hoped that this ork may in time enable each species to so graded according to structure and rresponding strength that the factor of safety ndered necessary by the tables at present ed by engineers, architects, etc., may be aterially reduced. If by any means it is und possible to do this in such a manner that, examination of the structure, an engineer ay at once know within moderate limits strength of a log the work will be of immense ue. But even apart from this the work l be of service by enabling consumers to dily find substitutes for woods which are oming scarce.

Other tests are being made in this section to ermine the effect which the treatment of od under pressure in the process of preserving on its mechanical properties.

The effects of different methods of seasoning the mechanical properties are also investiated.

(2) Timber Physics Department.

In this section studies are made of the ysical properties of wood and their relation structure. These include determination of specific gravity, specific heat, the effects changes of temperature, pressure and sture on the wood substance and general isture, etc. These researches have a special ring on the artificial treatment of wood the processes of seasoning, fire-proofing, serving under pressure, etc., when it is portant to know the effect of different ssures, the amount of heat required, the gth of time different kinds of wood may be osed to certain conditions, and so forth. results of this work therefore serves as a uable check on the experiments of other artments.

The main equipment of this laboratory consists a very complicated apparatus which was ially designed for studying the problems nected with the artificial seasoning of wood. n this apparatus it is possible to study the ience of variation of one factor while the rs remain constant, and a wide range of ditions in seasoning can thus be controlled.

Wood Preservation and (8) Pathology Departments.

The wood of these two departments is so ly connected that it is simpler to describe r together. The Wood Preservation oratory contains a very complete equipment testing the various problems of wood preation by treating the wood with materials h increase its durability.

ese problems may be divided broadly two classes :—

Those dealing with the preservatives selves, their effect on the wood and their ency in resisting fungi, insects, and fire.

Those concerned with the methods of ng the preservative into the wood.

In the study of the first of these problems preservatives are analysed and fractionally led in the chemical laboratory. The ency of each preservative and its different ons is then tested by subjecting woods ed with them to the action of wood-oying fungi or animals, and noting their ve powers of resistance. The effects of ner on the preservative in the treated mens are also investigated and taken into nt in judging efficiency.

this work the Products Laboratory erates with the Pathological Department Bureau of Plant Industry and also with Bureau of Entomology. A qualified logist from the former Bureau has an in the Forest Products Laboratory, and es the whole of his attention to the tion and study of wood-destroying fungi. cultures of these are made and kept in in large jars, and the resistant power of the vatives is tested by plunging treated hens of wood into these jars.

efficiency of each preservative or of its nal distillates is also tested by making e media of wood-destroying fungi to the preservatives are added in different tage strengths. The extent to which the fungus succeeds in growing in such media affords an indication of the efficiency of the preservative.

Experiments of a similar kind on a larger scale are also being attempted in a fungus pit which has been specially constructed below the floor in one corner of the Wood Preservation Laboratory. This pit contains large chambers in which the temperature and humidity can be regulated, and, when the conditions favourable to the growth of each particular fungus have been ascertained a culture of this fungus is grown in one of the chambers. Specimens treated with different preservatives are then introduced and inspected at intervals to ascertain the resistant properties of the preservative. Up to the present, however, the fungus pit has not worked very successfully, owing to difficulties in regulating the conditions necessary for each particular species of fungus.

(*b*) The equipment for studying the second class of problems, *viz.*, the methods of impregnating the woods with the different preservatives, is very complete.

Other problems, such as the loss of preservatives by evaporation at different temperatures, the relative inflammability of woods, etc., are being investigated with the help of ingenious pieces of apparatus designed for each problem. With this equipment the laboratory is enabled to put any theories which have been evolved through researches on a small scale to a practical test on a semi-commercial scale. In these larger experiments various commercial concerns gladly co-operate with the laboratory, for the work is already proving of immense benefit to railroads, shipping and mining companies, municipal bodies (for street paving), telegraph and telephone companies, farmers, etc. At the present time railroad ties which have been treated in various way in this laboratory are in use on a reserved length of the track of the Chicago, Milwaukee, and St. Paul Railway.

Piles which have been treated to test the possibility of preserving them against marine boring animals have been sunk in the waters of the Gulf of Mexico and the Bay of San Francisco.

In many other parts of the United States these are test tracks, pole-lines, fence-lines, mining props, and greenhouse timbers set out under actual service. The location of all these test timbers is kept on a map at the Products Laboratory, and they are inspected annually by members of the Staff, who keep careful records of the condition of every piece.

(4) Wood Distillation Department.

In this laboratory studies are made of the products obtainable from different woods and the most economical methods of extraction. The equipment consists of one steam distillation and extraction retort, one oil-jacketed destructive distillation retort, and stills for refining. The department also conducts turpentine-distilling operations on a semi-commercial scale in co-operation with a turpentine factory in Georgia, where a fractionating column still has been set up for this purpose.

The work of this department is of high economic importance, for its main object is to find a profitable use for the enormous waste of material which occurs, not only in the forest in hte shape of tops, branches, and stumps, but also in the saw-mills and factories, in the shape of slabs, ends, shavings, and sawdust. The disposal of surplus sawdust over and above that used as fuel is a question which confronts mill-owners in every country, who generally dispose of it in a refuse-burner. Processes for converting it into ethyl alcohol (grain alcohol) or other substances have been attempted from time to time in different countries, but hitherto without enough success to warrant the general adoption by mill-owners. This question is being closely investigated by this department, and designs for an experimental plant to produce ethyl alcohol from sawdust are now being drawn up.

Another line of investigation has been the commercial methods of collecting and refining turpentine, and the improved methods suggested are gradually being adopted by the trade. In this work the department co-operates with the paint and varnish makers to see how far the uses of turpentine and pine-oil can be extended. The question of finding substitutes for the rapidly disappearing long-leaf pine as a source for the production of turpentine is also engaging attention.

LABOUR IN THE BUILDING TRADE.

At the Caxton Hall, Salford, a private Conference of representatives of different building trade unions was held on the 23rd ult., to consider the proposal to amalgamate. There were sixteen delegates present, representing about 180,000 members of these unions in the United Kingdom. Mr. William Thorne, M.P. (Chairman of the Parliamentary Committee), was in the chair, and there were present also Mr. C. W. Bowerman, M.P., and Mr. William Mullin. The Conference had under consideration a scheme adopted by the Operative Bricklayers' Society, and after discussion this was adopted with some slight amendment. The scheme as adopted will be submitted to a further Conference, which is to be held in London on Friday, June 21.

Despite the declaration of the Assistant-Organiser of the Carmen's Union that the building trades are determined to join the strike, a correspondent writes, says the *Westminster Gazette*, that it is hoped that the dispute in those trades is now partially settled. The London Master Builders' Association has met and approved of the action of its Council in a proposed agreement with the Amalgamated Society of Carpenters and Joiners.

The agreement provides for union and non-union men working together and no questions of disability or disqualification being raised in consequence of belonging to a trade society.

All the old rules are to remain in force except that the short hours of the winter will be extended from thirteen to seventeen weeks, and the Association proposes (subject to some greater elasticity than at present exists in the starting and leaving off) to advance the wages from 10½d. to 11d. per hour in September, and to 11½d. in March. It will be remembered that the original demand of the men was for 1s. per hour.

It may be anticipated also that a settlement on somewhat similar lines will be reached with the labourers, who, like the joiners, were asking for an advance of 1½d. per hour.

A NOVEL SCHOOL, CHOPPINGTON.

The new Council school buildings at Choppington, Northumberland, were officially opened on Monday of this week by County Councillor A. McHugh. The school, which is the first of its kind in the country, is a very interesting example of a building where some method of reinforcement had to be employed to counteract, as far as possible, the effect of pitfalls or total demolition from possible colliery subsidence. There are two departments, infants' and mixed, each being a separate building. The former is built to accommodate 168 children and the latter 400. It is in regard to the mixed department that the experiment has been tried. Forming three sides of a square, each side is separate in itself, so that should a subsidence occur in one portion of the building it would not necessarily follow that the whole school would be damaged.

The school, which is of brick, is built in three sections, completely independent of each other, with the foundations and walls reinforced. The mortar courses are reinforced by a wire mesh of best mild steel wire galvanised and having tensional wires running its entire length. The foundations, which are also in three different sections, are reinforced on the Hennebique system.

The school is built with a 9-in. cavity wall in place of an ordinary 14-in., and consists of a 4½-in. outer wall, 1½-in. cavity, and 3-in. brick on edge inner wall.

The classrooms are divided by 2-in. brick on edge walls, with a 3-in. cavity between, and the division walls are 3-in. brick on edge, reinforced.

The cost of the school works out at 11*l.* 16s. per head, and has been erected by Mr. J. Douglass, Hepscott, near Morpeth, from the plans and under the superintendence of Mr. G. Topham Forrest, Lic.R.I.B.A., the Architect to the County Authority.

The following is a list of sub-contractors :—Foundations, Messrs. Hennebique, Ltd.; heating, Messrs. Swinney Brothers, Morpeth; wood-block floors, Messrs. Hollis Brothers, Hull; hardware, Mr. James Gibbons, Wolverhampton; sanitary goods, The Leeds Fireclay Company, Ltd., Wortley, Leeds; folding screens, Messrs. Stones, Ltd., Ulverston; steel wire reinforcement of walls, Messrs. Richard Johnson, Clapham, & Morris, Ltd., Lever-street, Manchester.

GENERAL BUILDING NEWS.

FERME PARK BAPTIST CHURCH AND SCHOOLS, HORNSEY, N.

Additions in the form of classrooms, etc., are being carried out at this building by Messrs. Battley, Sons, & Holness, of 21, Old Kent-road, S.E., the contract amount being 1,311*l.* The architects are Messrs. George Baines & Son, 5, Clement's Inn, Strand, W.C.

NEW CHURCH, EDINBURGH.

The Charteris Memorial Church has just been completed and provides seating accommodation for 427 persons. The basement contains a large hall holding 320 people, with retiring-rooms, and there are also rooms for the caretaker and two rooms and bathroom for the use of the resident surgeon. The plans were prepared by Mr. James B. Dunn, F.R.I.B.A., architect, of Edinburgh.

CHURCH, WOTTON.

The new church of St. Catharine is being erected at a cost of about 7,500*l.*, from the designs of Mr. W. B. Wood, A.R.I.B.A., of Gloucester. At present only the nave, aisles, and base of the tower are to be built, but choir and morning chapels, baptistry, and vestries are to be added later. The contractors for the work are Messrs. J. Byard & Sons, of Gloucester, and Messrs. G. N. Haden & Son, of Trowbridge, are supplying the heating installation.

ST. PETER'S CHURCH, ABERCANAID.

Messrs. Santo, Spencer, & Co., of London, are the contractors for this church, which has been erected at a cost of 2,600*l.*, and provides accommodation for 375 people. The building was designed by Mr. T. Edmund Rees, architect, of Merthyr.

NEW SCHOOLS, MALDON.

The plans for these schools were prepared by Mr. A. S. R. Ley, architect, and the schools will hold 600 children. The contractors are Messrs. Dowsing & Davis, of Romford, and the lighting is by the Maldon Gas Light Company, Ltd.

GLOUCESTER UNITED SCHOOLS.

Increased science accommodation will be provided soon at the Crypt Grammar School. The scheme proposed by Mr. W. B. Wood, A.R.I.B.A., and adopted, will give accommodation for several new laboratories and a lecture-room.

CHILDREN'S HOSPITAL, SUNDERLAND.

Messrs. W. & T. R. Milburn are the architects for this hospital, which was opened last week and erected at an estimated cost of 20,948*l.* The main buildings consist of a central administrative block with two pavilions on each side and accommodation for fifty-four patients. The contractor was Mr Joseph Huntley, builder, of Sunderland.

MARKET IMPROVEMENTS, ABERDEEN.

The reconstruction of the Central Hall in the new Market Buildings, Aberdeen, is being carried out from the designs of Mr. William Kelly, A.R.S.A., of Messrs. Kelly & Nicol, architects, and the scheme provides for the erection of four large pavilions in the centre of the hall and for butchers' shops underneath the gallery. The contractors for the work are Messrs. M'Andrew & Co. for the pavilions, and Mr. Isaac Wishart for the shops.

TRADE NEWS.

Under the direction of Mr. W. C. Hawke, A.M.Inst.C.E., Borough Engineer, Dover, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, have been applied to Barton-road Girls' School, Dover.

Messrs. Patman & Fotheringham, Ltd., 100 and 102, Theobalds-road, London, W.C., also of Park-street, Islington, N., have secured a large contract for rebuilding Nos. 2, 3, and 4, Tavistock-street, and Nos. 4, 5, 6, and 7, Exeter-street, Covent-garden, W.C., for Mr. George Monro.

The Council Schools, Bont, are being supplied with Shorland's warm-air ventilating patent Manchester grates by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

BRISTOL MASTER BUILDERS' ASSOCIATION.

The annual summer excursion of the Bristol Master Builders' Association will take place on Wednesday, the 19th inst. The party will go by rail to Totnes, thence down the River Dart by boat to Dartmouth, where luncheon will be provided at the Royal Castle Hotel. Members will then have the option of proceeding to Torquay by boat or rail for dinner at the Queen's Hotel, returning by rail to Bristol.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERYSTWYTH.—Conversion of militia barracks into houses; Mr. Lewis Evans, architect, Aberystwyth.

Abingdon. — Alterations to police-station (730*l.*); Mr. J. F. Hawkins, Surveyor, Bank-chambers, Cross-street, Reading.

Alnwick.—Church hall; Mr. W. Knowles, architect, 25, Collingwood-street, Newcastle-on-Tyne.

Appleby.—Premises; Secretary, Working Men's Conservative Club, Appleby.

Armagh.—Seventy-six houses (11,430*l.*); Surveyor, Town Hall, Armagh.

Ashby.—Church; Vicar of Bottesford, Doncaster.

Ashford.—Additions, school; Mr. W. H. Robinson, architect, Caxton House, Westminster, S.W.

Audlem (Cheshire).—School; Mr. R. P. Ward, County Buildings, Chester.

Barrowford.—Printing works, Ingham and Butterfield streets, for Messrs. T. W. Bateman & Son.

Belfast.—Buildings at Hamilton graving dock for Messrs. Harland & Wolff, Belfast, building, Sydenham-road, for Messrs. T. Anderson, Ltd.

Belfield (Lancs).—Church, St. Ann's Parish (3,500*l.*); Mr. R. B. Preston, architect, Diocesan-chambers, 51, South King-street, Manchester.

Bilton (West Riding, Yorks). — School (1,100*l.*); Mr. W. V. Dixon, Shire Hall, Wakefield.

Birmingham.—Additions to hospital; Mr. W. H. Ashford, architect, 90, New street, Birmingham. Theatre; Mr. G. Cox, builder, Handsworth, Birmingham. Additions to Canning's premises, Constitution-hill; Messrs. Cossins, Peacock, & Bewlay, architects, 85, Colmore-row, Birmingham; Mr. T. Elvins, builder, Naden-road, Soho, Birmingham. Church, Soho-hill; Mr. T. Elvins, builder, Naden-road, Soho, Birmingham.

Chadwell St. Mary.—Special subjects centre at school (2,973*l.*); Mr. G. Brown, builder, Grays, Essex.

Chatham. — School, Ordnance-street; Mr. G. E. Bond, architect, High-street, Chatham.

Cockermouth.—Proposed infirmary, Grecian Villa Estate; Mr. J. H. Musgrave, Clerk, Guardians' Offices, Cockermouth.

Colchester.—School, Hamilton-road; Mr. Duncan Clark, architect, 3, High-street, Colchester.

Coventry.—Proposed pavilion, Spencer Park (900*l.*); Mr. J. E. Swindlehurst, Surveyor, Town Hall, Coventry.

Crewe.—Church, Earle-street (5,000*l.*); Vicar, St. Peter's Church, Crewe.

Darlington.—Picture hall, Gladstone-street; Mr W. H. Hoskins, architect, Coniscliffe-road, Darlington.

Hull. — Bottling stores, Raywell-street; Messrs. Harbron & Robson, architects, 50, Spring-bank, Hull. Stables, etc., Cleveland-street (16,000*l.*); Mr. A. E. White, City Engineer, Town Hall, Hull.

Kells, N.B.—Housing scheme for Urban District Council; Mr. M. Grace, architect, Oldcastle.

Leith.—School on site of North Leith Poorhouse (1,196 places); Leith School Board.

Littleborough.—Additions at Dearnley Mill for Messrs. Ogden & Doodson.

Longford.—Alterations to New Inn for Messrs. Phipps & Co.

Manchester.—Rebuilding premises (10,000*l.*) for Messrs. McConnell & Co., cotton spinners, 90, Henry street, Ancoats.

Merthyr Tydfil.—Library, etc.; Mr Ed. Johnson, architect, St. Mary's-chambers, Monk-street, Abergavenny.

Newcastle-on-Tyne.—Church institute, St. Margaret's; Mr. W. H. Wood, architect, Collingwood-street, Newcastle.

Newmarket.—Technical institute; Mr. H. J. Linzell, builder, All Saints'-road, Newmarket.

Nottinghamshire.—Schools, Brinsley (1,000*l.*) and Selston (4,000*l.*); Mr. L. Maggs, Architect, Shire Hall, Nottingham.

Old Colwyn.—Convalescent home; Mr. C. Cowlishaw, architect, Stafford-street, Hanley.

Penstone.—Offices and public hall (4,000*l.*); Mr. C. Collins, architect, 10, Regent-street, Barnsley.

Pentrecelyn and Tanyfron.—School and school-house (800*l.*); Mr. D. Wiles, architect, High-street, Wrexham.

Plymouth. — Six houses, Mannamead (13,000*l.*); Mr. W. Palk, jun., builder, 48, Calbourg street, Plymouth. Car sheds, etc., Prince Rock; Mr. J. Paton, Engineer, Town Hall, Plymouth.

Redditch.—School (6,450*l.*); Messrs. J. & A. Brazier, builder, Worcester-road, Bromsgrove.

Ripon.—Cabinet-making factory; Mr. T. Stokes, architect, Westgate, Thirsk.

Rochdale.—Extensions to baths, Smith-street (9,500*l.*); Mr. S. S. Platt, Surveyor, Town Hall, Rochdale.

Sheffield.—Enlargement of Union Hospital (20,000*l.*); Mr. A. E. Booker, Clerk, Guardians' Offices, Sheffield.

Smethwick. Extensions to works, Halford-lane, for Messrs. H. Hope & Sons, Ltd.

South Elmsall.—Institute for the Carlton Main Colliery Company.

Stalybridge.—Extensions and alterations to baths (6,400*l.*); Mr. J. N. White, Surveyor, Town Hall, Stalybridge.

Tenbury (Worcester).—Drill hall; Mr. F. Smith, architect, Foregate-street, Worcester.

Uxbridge.—Alterations to school, Cowley-road (544*l.*); Mr. W. S. Fry, builder, Cowley, Middlesex.

Warrington.—The following plans have been passed: Six houses, Cumberland-street, for Mr. A. Wright; additions to tannery, Winwick road and Buckley-street, for Messrs. A. Waring & Co., Ltd.; warehouse, Claude-street, for Messrs. Rylands Brothers, Ltd.

Whitmore Reans -School, etc., Hornden-road (10,395*l.*); Mr. F. J. E. Tooley, builder, 1, Castle-street, Wolverhampton.

Worcester.—Addition, laundry, St. George's square; Mr. A. Parker, architect, Church House-chambers, Worcester. Theatre; Messrs. Rowe & Son, architects, Foregate street, Worcester, Messrs. Stokes Brothers, builders, Worcester.

BUILDING TRADE IN SOUTH AFRICA IN 1911.

THE Imperial Trade Correspondent at Durban (Mr. A. D. C. Agnew) has fowarded an extract from the *Natal Mercury* dealing with the state of the building trade in the Union in 1911. The following figures are given showing the value of the plans passed by the principal municipalities during 1910 and 1911:

—	1910.	1911.
	£	£
Transvaal	3,414,571	2,771,611
Natal	277,961	259,077
Cape Colony	242,725	329,257
Orange Free State	11,215	35,334
Total.....	3,944,472	3,195,279

The figures for the Transvaal show a decrease of 840,960*l.*, which, however, is accounted for by the fact that large Government contracts now proceeding were included in the 1910 figures, and also that there was abnormal activity during 1910 in the outlying mining districts such as Boksburg, Benoni, Germiston, and Krugersdorp. A good feature shown by the returns is the market activity in the coast towns.

The following table shows the values of some of the chief items of building material and requisites imported into the Union of South Africa during 1910 and 1911:—

Articles.	1910.	1911.
	£	£
Bricks for building.....	671	22
Cement	116,811	104,405
Electrical fittings	357,947	259,907
Furniture—		
School and church decorations	13,215	21,024
Other	321,803	410,722
Glass, plate	20,452	25,162
,, window	20,451	21,974
Glassware	50,225	59,960
Girders, beams, joists, etc. (including framework of iron buildings)	91,129	75,382

BOOKS.

yways in British Archæology. By WALTER JOHNSON, F.G.S. (Cambridge: At the University Press. Price 10s. 6d. net.)

t first sight this work appears to be a collection disconnected essays, but, as the author marks in his Preface, they really possess a ong bond of continuity. Running through e whole, implied, when not actually expressed, ll be found an insistence on the principle of Folk-Memory" dealt with in the author's rk under that title. As he says, "This folk-mory—unconsciously for the most part, t sometimes with open ceremony—keeps ve those popular beliefs and practices which o individually called survivals. With some these legacies from the past the present ume deals." Included in the book are two apters on "Churches on Pagan Sites," on "The Secular Uses of the Church bric," and one on "The Orientation of urches"; and these chapters, forming ctically half the volume, are those which ll be of special interest to our readers, much the remainder of the work treating of some-at more familiar themes, and it will thus be n that to a large extent the studies are nected with the church and churchyard. e sections which treat of pagan sites, orienta-n, and burial customs, embody the results observations relating to some hundreds of ldings in all parts of England and Wales. ne of the matters discussed have given rise to much controversy, and, as the author remarks, "to anticipate agreement with all the conclusions would be sheer folly. Nevertheless, it may be claimed that the facts collected have been carefully sifted, the references conscientiously verified, and the opposing theories honestly presented," and with these observations we are in hearty accord, believing that the work will be accepted as a valuable contribution to several interesting subjects.

Amateur Joinery in the Home. By G. ASHDOWN AUDSLEY, LL.D., and BERTHOLD AUDSLEY. Demy 8vo. (London: G. Allen & Co., Ltd., Ruskin House, Rathbone-place, W. Price 4s. 6d. net.)

THIS is another of that useful series of technical and art manuals now being produced by Messrs. Allen & Co., treating of either entirely new technical processes or of old processes under new and up-to-date developments, and supplying handbooks suitable for those who care to engage in industries suitable for leisure hours in the home. The work before us is a thoroughly practical manual on amateur joinery, describing the simple formative processes involving the proper use of the several ordinary tools required. In addition to the illustrations in the text, it contains twenty-one full-page plates of designs for articles of furniture such as the amateur joiner will set himself to construct. In these plates details of construction are shown by elevations, sections, and special enlarged drawings, all of which are drawn to scale. All the plates are described, and suggestions for the most suitable woods and their finishings are given. The designs have been drawn specially for the manual by the authors, who have produced a useful work which should command a large sale.

The Society of Engineers (Incorporated) Transactions for 1911. (London: Published by the Society. 1911.)

ALTHOUGH chiefly interesting to members of the engineering profession, this annual volume contains some papers of direct interest to architects. Such, for example, are: "The Design of Tall Chimneys," by Professor Henry Adams; "Petrol-Air Gas," by Mr. E. Scott Snell; "Drawing Office Organisation," by Mr. F. G. Woollard; and "The Protection of Water Supplies," by Mr. H. C. H. Shenton.

As the proceedings of the Society have been reported in our columns further reference to the contents of the volume is scarcely necessary.

Pictures by Sir Henry Raeburn, R.A. (London: Wallis & Son, The French Gallery, Pall Mall, S.W. Price 10s. 6d. net.)

THIS is a catalogue of the portraits by Raeburn, some thirty in number, exhibited at the one hundredth exhibition at the French Gallery. Some of the pictures illustrate the best work of the artist, and the collection, as a whole, affords a good opportunity of studying the painter's method. The first, and perhaps the last, thought one has in looking at this collection is that Raeburn was a master in producing what is called a speaking likeness, and that he could suggest character in the pose and features of his subjects in an unerring manner. His men, in our opinion, are more convincing than the women, but the collection includes some charming portraits of women as well. Many of the portraits were unknown to the present generation before they were exhibited, and it is a matter for congratulation that they were brought together, and that Messrs. Wallis & Son have issued this admirable catalogue of reproductions and notes.

No. 46, Lincoln's Inn-fields: Balustrading and Plasterwork.

The Parish of St. Giles-in-the-Fields (Part I.). Being the third volume of the Survey of London, with Drawings, Illustrations, and Architectural Descriptions. By W. EDWARD RILEY, Architect to the Council. Edited, with Introduction and Notes, by SIR LAURENCE GOMME, Clerk of the Council. (London: Published by the London County Council. 1912. Pp. 135; 98 plates.)

LINCOLN'S INN-FIELDS, the giant progenitor of a long line of lesser "squares that court the breeze," is the worthy subject of this, the third volume of the Survey of London, issued once more under the auspices of the London County Council. The homely, tree-planted square, as distinct from the bleaker and more grandiose "place" of the Continent, is a peculiarly metropolitan feature of which the Londoner may well be proud, and Lincoln's Inn-fields, with an area equalling that of the base of the great Pyramid, excels them all in architectural and historical interest, as it does in size. The manner of its evolution from the suburban pastureland of Cup Field and Purse Field is well sketched in his introduction by Sir Laurence Gomme, who has turned the iconoclastic rays of scientific research upon his subject, and proved that there is no direct evidence to support the hackneyed assertion that Inigo Jones furnished the design for

the façade of the houses on the western side of the Fields. Whether the design was really from his hands is no more than a matter for conjecture; the precise wording of the charge to the Commissioners appointed in 1618 to lay out the Fields, upon which the statement rests, is that they should take steps that "the said closes and grounds . . . may be framed and reduced both for sweetnes, uniformitie, and comlines into such walkes, partitions, or other plottes and in suche sorte manner and forme both for publique health and pleasure as by the said Inigo Jones (one of the Commissioners) is or shalbe accordingly drawne by way of mapp or ground platt exhibited plained and sett out." In all this the reader will note not one word as to any architectural design, nor were any building operations entered upon till one William Newton acquired the leases of Cup Field and Purse Field, and was granted a licence in 1638 to build thirty-two houses. An agreement, the veritable charter of the London square, was entered into between Newton and the Society of Lincoln's Inn that the "square piece of ground extending from Turn Style Lane to the new buildings neer Queene's Street and from thence to or neere Lowche's Buildings, and from thence to the south-east corner of Lyncolin's Inn wall shall from hence-fourth and for ever hereafter lye open and unbuilt." By 1641 most of the houses on the western side of the Fields, together with some on the south side of Purse Field, composing the western portion of what was afterwards known as "Portugal Row," appear to have been completed. In 1657 arrangements were made to finish the three sides of the Fields, by building on the north and south sides of Cup Field. The agreement concluded with the Society of Lincoln's Inn stipulating that the new buildings should "beare equall proportions in front, height, breadth, strength, and beauty, with the sayd Row called Portugall Row, or in a more firme or beautiful manner." Would that some such condition could have been enforced in the case of Regent-street before it was too late!

The introduction is excellently illustrated by two plans of the square showing the boundaries of the original fields as compared with the present disposition of the houses, and by reproductions from the maps of Hollar, Faithorne, and Morden and Lea, illustrating the progressive development of the site. We have no space here to discuss the point raised by Sir Laurence Gomme with regard to the Wilton House picture of the Fields; it is difficult, however, to believe that it can be anterior to the Canalesque school of Samuel Scott, or that anyone would take the trouble to have the canvas modernised by the painting in of up-to-date figures and accessories.

Turning to the architectural portion of the work, we must congratulate Mr. Riley on the excellence of the drawings and photographs by which it is illustrated; the half-tone blocks in particular mark a distinct advance on those of the previous volumes of the series. We are sorry to be unable to award the same praise to the heraldic drawing of the shields of the more noteworthy occupants of the Fields inserted in the margin of the text, nor is it easy to understand why the plan of the Sardinian Chapel should have been omitted, a plan of at least as much interest as that of an "alteration job" by Sir John Soane. The original XVIIth-century houses which compose the southern part of the western row retain little of their original detail internally, with the exception of the top flight of the staircase of No. 52, with its square ball-capped newels and substantial balustrading, of which a good photograph is given. One of the best houses from an architectural point of view is No. 35, which was erected with its next-door neighbour, since rebuilt, in 1754–5, from the designs of Sir Robert Taylor. Faced with stock brickwork, and devoid of all structural ornament, save for its plain stone string-courses and the dressings of the central window of the principal floor, it is an instructive example of successful astylar treatment, depending for its effect on the proportion and spacing of the fenestration, while fearlessly offering to the eye the repose of blank wall space denied to us by the architect of to-day. The fanciful arrangement of the sash-bars is a rare and pleasant departure from the stereotyped precedent of XVIIIth-century Palladianism. Internally the plan is cleverly dovetailed into that of the house next door, and the finishings throughout are of a most elaborate nature. One of the finest features is the geometrical stair with its wrought-iron balustrade. Newcastle House, now Nos. 66 and 67, was designed by one Captain William Winde, a Dutchman, and was erected during the closing years of the XVIIth century. In 1771 the house was divided into two and remodelled internally, the crowning cornice and central pediment being removed. At No. 56 is a fine mid-XVIIIth-century staircase. Sir John Soane's house, one of the most delightful pieces of planning in London, is adequately illustrated, and a reproduction is given of an interesting drawing, by George Scharf, showing the College of Surgeons in process of transformation by Sir Charles Barry. To each account is appended a list of the former occupiers, and brief notes are given of the more famous names among them. If Mr. Riley's remarks are sometimes rather obvious, we fully recognise that he is writing as much for the layman in matters architectural as for the initiated.

Farm Buildings. By C. EDWARD CURTIS. Illustrated. (London: Vinton & Co., Ltd., Bream's-buildings, Chancery-lane. Price 3s. 6d. net.)

As THE author explains, this little volume is addressed to land owners, their agents and tenants, and not primarily to architects and builders, but we believe it will be of value to architects and builders concerned in the erection of such buildings. The work contains many useful suggestions and hints, and shows a practical knowledge of modern requirements.

The Homeland Residential Guides.

THE Homeland Association, Ltd., have commenced the issue of a new series of guide-books, dealing with various provincial towns from a residential and industrial standpoint. The first town dealt with is Reading, and a great deal of very useful information is given by the author, Mr. A. H. Anderson, both with regard to the town itself and the surrounding district. Reading undoubtedly possesses many attractions as a place of residence.

No. 35, Lincoln's Inn-fields: Rear Room on Ground Floor.

LAW REPORT.

Architect's Fees.

By consent, judgment was entered for the plaintiff for twenty-five guineas and an agreement that the defendant return all drawings, in an action raised by Mr. William Davidson, architect, 54, Queen-street, Edinburgh, against the Rev. Charles Wilton Prangley, Bexwell Rectory, Downham Market, Norfolk, which had been set down for trial on May 1912. The claim was one for fifty guineas for services rendered by the plaintiff in preparing designs for a proposed restoration of Potter Heigham Church, Norfolk, and the defence was that any work which the plaintiff had executed was of the nature of an expectation that he was to be the architect in the event of the restoration being proceeded with. The defendant had accordingly denied employment.

OBITUARY.

Mr. W. Harrison.

The death on May 30, at Bognor, is announced of Mr. William Harrison, in his sixty-seventh year. Mr. Harrison was elected an Associate of the Royal Institute of British Architects in 1882; in 1867 he became a member of the Architectural Association. In 1893 he won the first premium with his designs for the St. Pancras Municipal Buildings in Pancras-road, and was invited to compete for the North London Polytechnic. His designs were placed second in the competition limited to six architects for the St. Giles-in-the-Fields Public Library, High Holborn, twenty years ago.

Mr. D. H. Burnham.

We regret to announce the death of Mr. Daniel Hudson Burnham, which occurred on June 2 at Heidelberg. Born at Henderson, New York, in 1846, he settled in Chicago, and in 1872 established the firm of Messrs. Burnham & Root, the partnership continuing till 1891, since when the firm has been Messrs. Burnham & Co. Mr. Burnham was an honorary graduate of Harvard and Yale, and was elected President of the American Institute of Architects in 1894. He was Chairman of the National Commission for beautifying the city of Washington, and was superintending architect of the World's Fair Exhibition, Chicago, in 1893. Well known in this country, he attended the Town-Planning Conference held in London in 1910, and read a paper on the subject of "A City of the Future under a Democratic Government," his work being well represented at the Town-Planning Exhibition. In our issue of October 29, 1910, illustrations were given of several street plans of Chicago, and buildings designed by the firm. Of the numerous buildings with which Mr. Burnham was associated the following may be mentioned in Chicago:—The Temple, the Masonic Temple, the Illinois Trust Bank, the First National Bank, the Railway Exchange, the Great Northern Hotel, Marshall Field's retail store, and the Ashland, Fisher, Reliance, Rookery, and Stewart buildings. We hope in a future issue to refer to Mr. Burnham's work and the influence it has exerted on contemporary architecture.

PATENTS.

APPLICATIONS PUBLISHED.*

25,415 of 1910.—Henry Carrington James-Carrington: Heating-apparatus of the closed circuit type.

10,692 of 1911.—Alexander Reid Stevenson: Fireplaces.

10,839 of 1911.—Louis de Lenne, Marcellin Langlois, Antoine Sauvage, and George Langlois: Paving and coverings or facings for roads, footways, and other surfaces.

10,846 of 1911.—Franklin Herbert Kalbfleisch: Sizing compound and the production thereof.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

11,647 of 1911.—Charles William Julians and Stuart James Hogg: Manufacture of artificial stone.

11,802 of 1911.—Gustav Knappe: Casement windows.

12,036 of 1911.—Christopher Mountany: Means for and method of distributing sewage and other similar liquids.

13,358 of 1911.—William Stevens Hardman and George Burdett: Ladders.

14,370 of 1911.—Russell Elliot Macnaghten: Top sash-window ventilators.

14,377 of 1911.—Charles Showell: Bolt-controlling mechanism for emergency exist doors and the like.

14,761 of 1911.—Charles William Wood: Door-stops.

15,648 of 1911.—John Archibald Kenrick and Harold Musson Williams: Door closing and checking appliances.

16,471 of 1911.—James Johnston: Window-sashes.

17,342 of 1911.—United Motor Lock and Fittings, Ltd., and William Henry Appleby: Locks and latches.

18,546 of 1911.—Marcar Balaban: Window-sashes and fittings therefor.

19,481 of 1911.—William Davidson Simonton: Securing of escutcheons or keyhole plates.

20,160 of 1911.—Charles Louis Abel Janoyer: Method of setting or placing floor-bridging joists without fastening them on iron joists.

21,150 of 1911.—Julius Zerkowitz: Chimneys.

22,247 of 1911.—Benjamin Willson Smith: Cooking-ranges.

23,106 of 1911.—Joseph Gill: Fastenings for sliding sashes, windows, and the like.

28,288 of 1911.—Alexandro Deprit: Glass mosaics for covering walls and floors and for other similar purposes.

1,247 of 1912.—Joseph Janes: Manufacture of bricks or the like.

2,055 of 1912.—Thomas Malcolm McAlpine: Contrivances for reinforcing structures composed of concrete blocks.

2,570 of 1912.—Thaddious Vensent Elliott: Grates.

2,935 of 1912.—Lew Ogan: Dampers.

No. 35, Lincoln's Inn-fields: Wrought-Iron Panel. (*See page 675.*)

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xvi.; Auction Sales, xxii.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Competitions.

JUNE 24. **Reigate.**—CORPORATION FARMHOUSE.—Not to exceed 550*l.* Local architects only. Premium 10*l.* 10s. Particulars from the Town Clerk, Reigate.

JUNE 24. — **Wales.** — TWO SANATORIA. — The Executive Committee of the King Edward VII. Welsh National Memorial invite architects to submit sketches for two sanatoria, one in North and the other in South Wales. Accommodation, 150 and 250 beds respectively. See advertisement in the issue of May 31, and the note in this issue (page 666) for further particulars.

JUNE 26.—**Birmingham.**—BATHS.—Twenty and 10 guineas for second and third designs. Applications for conditions to be sent to the Superintendent Engineer, Kent-street, Birmingham. See note on page 666.

JUNE 28.—**Hale, Cheshire.**—TOWN-PLANNING SCHEME.—Premiums 50*l.* and 25*l.* Particulars from the Council Offices, Hale. See issue of May 24 (page 601).

* JUNE 28.—**Regent's Quadrant.**—DESIGN FOR TREATMENT.—Premiums, 25 guineas, and 26 guineas divided. Adjudicators, Mr. W. Flockhart, Mr. E. A. Rickards, and Mr. Alan E. Munby. See advertisement in this issue for further particulars; also "Competition News," issue of April 19 (page 453), May 3 (page 512), May 10 (page 537).

JUNE 29.—**Reigate.**—LAYING-OUT AND DEVELOPING REIGATE LODGE ESTATE.—Premiums 30 guineas and 10 guineas. Particulars from the Town Clerk, Reigate.

JUNE 30.—**Padiham.**—TOWN HALL, BATHS, ETC. —Premiums 40*l.* and 20*l.* Particulars from Mr. J. Gregson, A.M.Inst.C.E., Surveyor's Office, Padiham.

JULY 1.—**Dusseldorf.**—A plan for the extension of the City of Dusseldorf. Premiums of 1,000*l.* to 375*l.* Conditions on application to the Chief Burgomaster, Dusseldorf. A translation appeared on page 365, September 29.

JULY 1.—**Port of London.**—NEW OFFICES.—Limited to those mentioned in "Competition News," issue of April 12 (page 424).

* JULY 5. — **Conisbrough.** — ADDITIONS TO HOSPITAL.—The Doncaster and Mexbrough Joint Hospital Board invite competitive plans for additions to Isolation Hospital. See advertisements in the issue of May 17 and this issue for further particulars.

AUGUST 6. — **Cardiff.** — FIRE-STATION. — The Cardiff Corporation invite designs and estimates for a fire brigade station in Westgate-street. Mr A. Marshall Mackenzie, assessor. Particulars from the Town Clerk, City Hall, Cardiff.

AUGUST 30. — SAXON SNELL PRIZE. — Fifty guineas, with medal, is offered for essay on "The Lighting, Heating, etc., of an Operating-Room for a General Hospital." Particulars from the Sanitary Institute, 90, Buckingham Palace-road, S.W.

SEPTEMBER 30.—**Dublin.**—UNIVERSITY COLLEGE: NEW BUILDINGS.—Limited to architects in Ireland. Assessor, Mr. H. T. Hare, F.R.I.B.A.

OCTOBER 1. — **Ottawa.** — MONUMENT TO KING EDWARD VII.—Sketch models in plaster to be sent to the Director of National Art Gallery, Ottawa.

NO DATE.—**Jordanhill, Glasgow.**—PROPOSED TRAINING COLLEGE.—Limited to six firms, named in "Competition News," December 1, page 635.

NO DATE. — **Warrington.** — SCHOOL. — The Warrington Education Committee invite competitive plans for the erection of a public elementary school. See advertisement in issue of February 16 for further particulars.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

JUNE 8.—**Lissarda.**—RESIDENCE.—Erection of a curate's residence, etc., at Lissarda, co. Cork. Plans and specification with Mr. James F. M'Mullen, M.R.I.A.I., architect, 30, South-mall, Cork.

JUNE 8.—**Southwick.** — HALL.—Erection of a Public Hall. Plans seen, and particulars from Messrs. Joseph Potts & Son, 57, John-street, Sunderland. Quantities on deposit of 1*l.* 1s.

JUNE 10.—**Bexley.**—ROOM, ETC.—For erection of proposed ironing-room and other works at "Trewint," Cold Blow, Bexley, Kent. Drawings and specification at the home, and tenders to Messrs. J. C. Melliss & Co., civil engineers, 264, Gresham House, Old Broad-street, London, E.C.

JUNE 10. **Bournemouth.**—WALL.—For erection of a brick and concrete boundary wall at the refuse destructor. Particulars, form of tender, and specification, on deposit of 1*l.* 1s., with Mr. F. W. Lacey, M.Inst. C.E., Borough Engineer and Surveyor, Municipal Offices, Bournemouth.

JUNE 10.—**Bruree.**—CREAMERY.—Erection of a creamery near Bruree. Plans and specifications with Mr. Michael White, Loteragh.

JUNE 10. — **Butterknowle.** — HOUSE.—For the erection of a farm-house in Wham-lane, Butterknowle. Plans and specifications with Mr. Joseph Stephenson, East Rowntree Farm, near Hamsterley.

JUNE 10. **Dundalk.**—REPAIRS, ETC. - The Great Northern Railway Company (Ireland) invite tenders for the painting, plumbing, and repairs to their property, Mounthamilton House, Dundalk. Plan and specification at the Engineer's Offices at Dublin and Belfast, and form of tender from Mr. T. Morrison, Secretary, Secretary's Office, Amiens-street Terminus, Dublin. Deposit of 1*l.* 1s.

JUNE 10. — **Huddersfield.**—ADDITIONS.—Erection of an additional story to warehouse, St. Thomas's-road. Plans seen, and quantities from Messrs. Joseph Berry & Sons, architects and surveyors, 3, Market-place, Huddersfield.

JUNE 10. — **Merthyr Tydfil.**—PREMISES.—For pulling down old building and erecting business premises in High-street, Merthyr Tydfil. Plans and specification seen. Quantities, on deposit of 1*l.* 1s., from Messrs. W. M. Lewis & Walters, architects and surveyors, Pontypridd

FOREIGN AND COLONIAL.

City Hall, Montreal, Canada.

According to the *Montreal Daily Witness* of May 2, the plans of the new City Hall and annex have been approved by the Board of Control. The building will have granite foundations and a sandstone superstructure, and will serve as Police Headquarters, Recorder's Court, and Medical Health Department. Tenders for the construction of the building will be invited in the near future, and it is expected that the building will be occupied in a year.

Military Headquarters, South Australia.

The official *Bulletin* of the Intelligence and Tourist Bureau, Adelaide, of April 15, states that complete and modern headquarters for the State Military Department of South Australia are to be erected for the Defence Authorities on the land at Keswick, near Adelaide, which was acquired for the purpose by the Federal Government in 1910. The initial work comprises the erection of the administrative buildings, which are to be constructed of brick with cement stucco, and of barracks for the permanent artillery. When these are completed, officers' quarters and stabling will be erected. The complete scheme, which also includes various stores, railway sidings, etc., will involve a large expenditure.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not

PRICES CURRENT OF MATERIALS.

*** Our aim in this list is to give, as far as possible, the *average* prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

THE PARIS SALON.

ONE may say of the Salon—that is, of the exhibition of the Société des Artistes Français—always that t interesting and never that it is bad, er, or good. Such an aggregation of k as is here presented officially must ays be average, democratic, in the e of its having to accept the work all schools save the revolutionary the eclectic, and comparable, if one trouble with comparisons, properly with itself. It can never be very with average achievement as the dard—so much, at any rate, haldom can secure; it can never be d because by the laws of its being it t, for the most part, be mediocre; it must always be interesting as the ator of the level of the artistic mean attained, and considered tolerable by the mass of opinion in the country concerned.

The Royal Academy is, of course, our English counterpart, closely analogous by virtue of similar function. It is assailed with fury, or, as a matter of course, withered by contempt; occasionally it yields some measure of satisfaction to those who pay it the compliment of diligent criticism in the form of a more or less interested defence. Sometimes, as though he would present a paradox for our delight, a person of intelligence will arise and announce that there is really something to be said for it. But above—or perhaps one should say below—all the crackling cross-fire of condemnation and retort, our Royal Academy remains firmly founded, despite its closely bureaucratic control, on a truly democratic basis, and may rest assured so long as it continues to maintain the mean between what those who know better will tolerate and what those who wish worse desire.

So with the Salon; it is interesting as providing just that mean—as indicating always year by year the precise measure in which movements, in their beginning antagonistic, have permeated the mass with the spirit of their doctrines, each one contributing some partial influx to the maintenance of the life of that massed mediocrity they all set out to displace. It is best shown in the painting, of course, which is not here our immediate concern, because movements in painting

are, in these days, more conscious and avowed, and more easily seen and noted, than those, if indeed there be any considerable ones, in other arts. So one may trace things—here something seen first by the Impressionists, there a mere touch of the Post-Impressionists even; in one place a picture which might have been shown at the Indépendants a few years ago, in another the work of an artist who, last year among the Refusées, has deigned once more to put it to the test. And when once allowance is made for the differences between this kind of increment, for the technical dexterity that apparently knows no obstacle, and for the direction of popular appreciation, which runs less to pink prettiness, there is little in essentials to choose between French art in the mass and our own.

The same verdict holds with regard to the sculpture. Those who have been to a Salon in the Grand Palais will know what a preposterous amount of it is presented to the visitor at a glance—*coup d'œil* expressively. Those who have not can perhaps conceive a vision of the whole floor of the Olympia in London or any other erection large enough for a horse-show or a military tournament covered with pieces of all sizes, mostly of marble, all apparently—it is extremely difficult in such collections to look particularly at any one—accomplished, technically, up to the hilt, suave, smooth, pretty sometimes, petty nearly always, and as destitute of even any desire to attain the serene nobility that sculptors can embody, as any collection of modern Italian "real art," all done by hand, in the shop of a Dutch auctioneer. There are exceptions, of course, one or two busts apparently sincere, that will seem better doubtless in quieter surroundings; but of the pieces which might be applied to architecture, which we can think of—that is to say, as fulfilling the great decorative place of sculpture in the realm of the arts—there is little save what might fitly adorn a modern restaurant or casino. One great piece at least is avowedly a stone-carver's model of sculpture to be applied, in this case very much applied, in the modern French manner which we confess to disliking perhaps more than any other feature of this work, as though it were plaster thrown on and modelled in position to the discomfiture of any architectural line which might happen to have existed before. The work is labelled "Maquette demigrandeur du fronton du nouveau Théâtre de Lille." Architects will remember the design by M. Louis Cordonnier. The subject is, of course, "Apollon et les Muses," Hippolyte Lefebvre, the sculptor. The composition is built up of vague forms, ladies—the Muses—all alike save Melpomene, who wears a pained expression, but each with her "property," her functional attribute, emerging from swirling clouds and floating in her drapery. A fixed point is provided in the middle in the shape of a cartouche—its outline suffering somewhat, as does that of everything else, from the supersurgence of clouds—bearing a fleur-de-lis. Above this stands Apollo, very pretty with his lyre. The whole is set above the main cornice, splathers over the attic story, drowning its mouldings. It is nowhere confined. The sky-line—other outline it has none—is shapeless. The conception is restless, insipid. It might have been made as a demonstration to students of what sculpture should not attempt, of all the faults which, granting complete lack of inspiration, it could avoid, of the way in which sculpture forming part of the design of a building should never be allowed to behave. And yet one sees the same sort of thing happening all over modern French work. In their feverish design and facility on paper they put no bounds to the errors rendered possible by the complete subjection of their medium.

There are other examples that may come within the architectural purview, such as a few designs for monuments—the kind of work in which we in this country think of the French as excelling. One is a monument to Michelangelo—impertinent at the best, but here undeniably bad. From a commonplace base, clumsy, cloudy, and bulky forms reminiscent of some of the San Lorenzo figures emerge; while upon it, on a great stallion of the school of Rosa Bonheur, sits Michelangelo himself (one must suppose) looking like nothing so much as a bearded Boer warrior of a former time. There is a monument to Henry Cazales (Jean Lahor), a large slab in which a figure of Sorrow (or his wife) sits by a Hermes—bust of the hero. Trees loom behind. That is to say, the thing is a carved picture of a monument. One looks on the base of the Hermes for a carved representation of still another memorial—for where should this sort of thing, logically, stop? Another aspect is represented by a big piece, "Aux Gloires de Toulouse—Commandé par l'Etat." St. Louis—a pleasant statue—stands above, and four huge figures, shamefully outscaling him, perch uncomfortably upon the four sides of the base. Especially objectionable is the great coarse form of a female, presumably "Fame," since she has a tiny chisel in her hand, sitting in front, with her centre of gravity sadly beyond her control. Another immense composition, "Aux Morts, Aux Exilés: Deux Decembre, 1881," also "Commandé," is beyond our comprehension, and could add nothing to our despair. It belongs to the dramatic category. On the coping of a great plaster wall, perhaps 25 ft. long by 15 ft. high, a savage eagle, with a tablet of the "Loi" in its talon, rails at a desperate-looking Liberty with a broken sword. At either end of the wall are restless groups of suffering humanity—the "Morts" and the "Exilés" in question. We can see no real difference between this combination of the literal and the allegoric—the same which went to the making of the Michelangelo monument, and that to Henry Cazales—and a meticulous model of an old "diligence" in difficulties, which stands near by. It would be better for the nation which produces it had her sculptors to work with pieces of flint and wet their tools with their tears.

As architectural opinion in this country already suspects, French architecture likewise is beginning to suffer from that fatal facility in design and ease in execution which we have been accustomed to envy. Such buildings as the famous Opera House, with its multiplicity of detail, and the Gare du Quai d'Orsay and the Grand Palais des Beaux-Arts with the Pont Alexandre III. close by have become for us types of the great public building as it should be, broadly conceived and generously complete. And from that sound decision there has been a tendency discernible lately to deduce the more debatable conclusion that the details with which such erections are adorned, prolific in invention and perfect in execution as they almost always are, must be worthy to become the source of inspiration for our own work. Well, writing deliberately and thinking not only of the work exhibited in the Salons, but of new buildings to be seen in the streets of Paris, especially in the districts of Passy and the Place de l'Etoile, we may say that French detail has passed the limits of æsthetic rectitude. The contemporary architecture, in the narrow meaning we are accustomed to attach to the word—something, that is to say, chiefly concerned with the façade and immediate appearance of buildings—has nothing in its characteristic aspect that can be pointed out as certainly worthy of our emulation. But, although in its consummate ease and completeness of achievement we find little to admire, there is and be this noted—in its restlessness and gameness for experiment possibility of a development to be watched.

In the Salon of the Société Nationale des Beaux-Arts, in another part of the Grand Palais, there is, for instance, a very detailed set of drawings and photographs illustrating the design and building of a house in the Rue Belliard, close to the Porte.

It is built on a skeleton framework of ferro-concrete. The spaces are filled with walls of hollowed bricks, and the surface is treated with cement planted with light-coloured tiles, in such a way that the darker cement surface shows as a pattern of contiguous stars. The effect, to an English eye, is exceedingly distressing. But there it is—an experiment which could be undertaken only in the atmosphere of abandonment in which the designer of houses is allowed to disport himself—and who can say that it will lead to nothing in the problem before us of the treatment of a concrete surface?

We can take the two Salons—the larger of the Artistes Français and the smaller, but still very large, exhibition of the Beaux-Arts—together as far as the architectural exhibits are concerned, for, although they are very different in the matter of sculpture and painting—the latter, with its aim of a synthesis of the arts, being on a considerably higher plane—as regards architecture little difference can be discerned save that perhaps the Artistes Français is somewhat more advanced and extends a kinder consideration to the sort of experimental work instanced above. Besides the house by M. Deneux, there are two others by M. Vorin—experiments, not apparently executed, of the same kind. One observes, too, a design called the Rendezvous de Société, also of ferro-concrete, and having the upper *salle* considerably larger than the lower, so that in section it has the outline of a rather stumpy tree. In its synthetic

capacity the Beaux-Arts exhibits furniture also. It is in strange colours and has lines not yet clear of the mirage called L'Art Nouveau. Another item is a very clever paper model of a strange, fourfold, turntable airship shed; it is the sort of thing in which the modern Frenchman takes delight. One cannot perhaps commend it as it stands, but as a sign that in France the architect still takes his place as ingenious inventor it is not without significance. In that country he does not wait until the engineer has already "got well away" to exclaim to a callous world that this is really an architect's concern.

There are some designs for small and moderate houses about which we could say little that their designers would be pleased to hear. Our ideals for this sort of work are, and, we cannot help thinking, rightly, so different. The French have, however, what with us is a fault, but with them a quality—the saving grace of restlessness, not unhopeful in these days of flux and social readjustment.

One finds interspersed throughout a considerable quantity of archæological study, of the sort which cannot gain admittance to Burlington House. There we see enough of it dragged into what should be entirely modern design. In France it is undertaken apparently for itself alone. Our great display of church designs at the Academy this year, perhaps, for us, supplies its place. At the Salons there is apparently no such outlet. We remember only two designs for churches in all the collection. So much must be said before we come to that direction of endeavour for which French architects are famous, the aspect of their training from which we really have something to learn—the grand *projet*.

In this country we are becoming tolerably familiar with the *projet*. We see in its prevalence the guiding principle of the education of a French architect. What we do not realise quite so clearly, perhaps, is that the *projet*, the great conception, is the guiding principle of the French nation, and possibly of all Latin countries. It may be the fruit of Roman colonisation. The Romans, with their *projets* for forts, camps, towns, and even countries, subdued and harnessed by a *projet* of Roman roads, may have left it. It is, as far as government or communal impulse can make for it, the principle of the process called civilisation. It is in architectural design just an aspect of the great synthetic impulse which would make order out of chaos wherever it has power. It is, in a phrase, a manifestation of the Classic Spirit—so precariously maintaining its flame on this side of the Channel.

It is difficult for an English eye in looking at these schemes to see more than their overwhelming proof of the vitality of that synthetic concept, so much the very essence of classic design, so absent, it seems, from all considerations limiting the great opportunities which present themselves in our own country. The fatal lack of it is the fault of architects, as a body, not less perhaps, but certainly not more, than of the powers that be and of public opinion. However much we train our men in the handling of great schemes, it can only be to make them ready for opportunities which may never be presented—though there is no reason why their light should be hidden because we have but two very small annual exhibitions of architecture frequented by the public as distinct from the initiate. Here, in the Salons, there are great rooms which make nothing of a grandiose plan 8 ft. square or a section 12 ft. long. The drawings are mostly rendered to the scale of 1 cm. to the metre, which is nearly equal to our usual $\frac{1}{8}$ in. to the foot. They are drawn often with such splash that the part which is actually building has somewhat to be sought for in the confusion of shadows and ground tints which go to make the splendid pattern aimed at as the effect of the sheet as a whole. And so it comes about, as we noted above, for merely visual reasons as well, that the work is often confusing to the English eye.

But see what things they are and how the architect races with the times! We have *Une Ecole Supérieure d'Aviation Militaire* laid out on an actual piece of country, and perhaps eventually to be built. Besides the map and plan there are sectional elevations (10 ft. long) and a great *vol d'oiseau*. All things necessary are provided—barracks, workshops, garages, and grandstands, all grouped to form one comprehensive plan. Then, too, a *Station Militaire, Nautique et Aéronautique*—a great sombre, low-lying fort guarding a harbour and an aeroplane starting-ground behind. These things, too, are architecture, it appears. It is what Professor Geddes would call *geotecture*—changing the face of the globe.

See, too, how they seek occasions—and think of our Soane designs. A composition of *Salles de fête et de Réunion* with a *Jardin d'Acclimatation*. A great bulgy glasshouse like a monstrous balloon with a terrific, difficult but decorative plan. One does not like it; but that is not the point. The circumstance to note is that the furthest vase on some distant balustrade has its place in the scheme and preserves its relation as an integral portion of the whole. There is a scheme for *Une Exposition permanente à la Gloire de la Republique*. The plan is about 12 ft. square—perhaps 15 ft. over all, for they are mounted on strainers with effective grey and generous margins. From the Place de l'Etoile a great avenue cuts to the north-west through the Bois de Boulogne. Close by Longchamps it meets the Seine, and then become a "place," with a prodigious column in the middle and exhibition buildings grouped about it. It is not so well rendered as many of the schemes, but, beyond noting that, criticism halts.

The best scheme exhibited is by M. M. G. Castel. It is labelled "*A la Gloire des Lettres. Les Nouvelles Scènes et Théâtre National de la Comédie Française.*" Besides showing the characteristic grasp and maintaining that relevance to the aspirations of humanity as it is in France, which infuses these designs with something of the warmth of life, M. Castel's set is exceedingly well rendered and loses nothing as a decorative group by being as comprehensible as one could wish. On plan the permanent stage setting of a large open-air "*Théâtre Antique*" backs on to a great arcaded *salle* which forms the connexion between two other theatres *classique* and *moderne*. The stage ends of these two great gables, in the customary manner with enclosed theatres, face the audience in the open air, and augment in a splendid fashion the monumental aspect of that façade. On the other side the auditoria, roofed with flat domes, flank the loggia-like arches of the *salle*, to produce an effect almost of the Renaissance. Two Orders, one subsidiary and included within the other, are woven externally and internally throughout the composition, ensuring a maintenance of constancy of scale seldom seen in designs of such dimensions. Beyond and about are monuments, terraces, and colonnades. The drawings are supplemented by sketches in brilliant colour, showing the author's conception of the profusion of ornament to be employed. If one were to make any criticism the leading suggestion would be that the design lacks that vitalising asperity, that sense of ordination in its so symmetrical façade which one quick touch of asymmetry would provide. True, M. Castel has not omitted it altogether. There are three bull's-eye dormers on the modern theatre, presumably required by the different exigencies of the interior, which the classic theatre has only in a very subdued degree. But that slight difference is, in our view, not sufficient. The forecourt aspect of Versailles is the great exemplar of what one emphatic feature in asymmetry can do.

We cannot leave the exhibition without endeavouring to show, as far as it can enable us to do so, something of the practical outcome which this habit of *projets*, so much "in the air" as they seem to be, undoubtedly produces. This is not a good year for the purpose; there are no really large schemes, as far as one could discover, actually to be built. But there are three sets of drawings—the winner, the third premiated, and an unplaced design—of the competition instituted by the town of Niort, for the erection of a municipal theatre.

Not to take anything for granted, one must note, first of all, the circumstance that the Ville de Niort, a responsible democratic group of people, decided that a municipal theatre was a worthy object of expenditure, and desirable, perhaps even necessary, as a consonance or integral factor of the civic dignity. Only in a country where such a decision on the part of the representatives of the public is in the usual order of things could the problem, when presented, be met with so constant a concurrence of views on the part of competing architects as to the principles on which it is to be solved. As we have said, only three of the designs are exhibited; but they are sufficiently representative. They have certain qualities in common with each other and with most of the other designs submitted, which are of the system of great *projets*, and, secondarily, of the national conditions which demand from the architects, first of all, that they shall conceive with a largeness of spirit and produce, as the great quality, a simple coherence of design.

The site is isolated by the construction of two new streets—anything but an island site is not to be dreamt of in these days on the Continent; it is rectangular and apparently of just sufficient size.

The theatre is, as Continental theatres go, not a large one. The order in which the three designs have been placed is undoubtedly the right order. The assessors looked for the simplest arrangement of certain clearly-recognised elements of theatre design. They were probably not in the least troubled by any of the chaotic divergences in matters of principle which the assessor in this country has to overcome. Obedience to accepted ideals gives to the Continental theatre a constancy of arrangement comparable to that of the Gothic minsters and the Classic temples—a token by which one may know that the theatre is something of a temple, too, and not just a showman's booth.

On plan they are divided into three equal parts:—(1) The stage, with wings and dressing-rooms; (2) the auditorium, with its wide ambulatory on either side; (3) the vestibule and the foyer over it, with the staircases and the galleries. The first is cut off and dedicated to the players; the second holds the audience in the usual way; the third is common to all present, be they of the boxes or the gallery. In elevation these three parts are indicated with an easy truthfulness of architectural treatment necessitated by the requirements of the interior. Through them all, but especially in the winning design, there is that certainty as to first principles, that breadth of conception and unity in treatment which is the result of training in the grand *projet*. And this is the sort of thing they undoubtedly do better in France.

DANIEL HUDSON BURNHAM.

ALTHOUGH it is somewhat difficult for us in this country to appreciate rightly and do full justice to the extraordinary powers of the late Daniel Hudson Burnham, and even more difficult to estimate with any degree of accuracy the precise nature of the position which he occupied in the estimation of his colleagues and fellow-countrymen, we can yet recognise his outstanding abilities and regret the loss to contemporary architecture of a forceful and engaging personality.

It was perhaps his position as Superintending Architect of the World's Fair at Chicago in 1893 which first brought his name into prominence on this side of the Atlantic, but it was his subsequent work as a town-planner, more particularly his fine scheme for the remodelling of Chicago, exhibited at the Town-Planning Conference at the Institute in 1910, that brought him general recognition as an architect of large ideas capable of handling vast and intricate problems in a broad and comprehensive manner.

But, apart from Mr. Burnham's town-planning work and the various official positions which he held from time to time, it would probably be correct to say that to the majority of architects in this country he was known more as a leading representative of a system than as an individual personality. Of recent years the firm of Burnham & Co., of Chicago, has generally been considered one of the most successful of the large firms which are a characteristic feature of architectural practice in America.

The more successful and far-reaching the operations of such a firm the more, perhaps, the personal reputation of its head tends to merge into that of the firm; but there seems little doubt that it was just this method of conducting architectural practice which afforded scope for the supreme organising ability which appears to have been Mr. Burnham's outstanding gift. Although the conditions of practice which prevail in this country do not provide the same opportunities in this direction, yet a man of such ability and character would have made his mark in any circumstances, and would have distinguished himself in any sphere of life into which his inclination or his fate might have led him.

It is by no means easy for us to grasp at once the significance of such a career. It stands for a system which is not ours, for ideals which we do not fully share, and for a method of conducting architectural practice which we do not think capable of producing the very highest results. At the same time, we must realise that it appears exactly suited to the necessities of the case, the needs of a rapidly-expanding country—or Continent rather—in which big schemes have to be rapidly dealt with in a big manner. Also we must ungrudgingly admit that the best work produced by this method has many fine qualities, exhibits high technical knowledge and skill, and is, in many respects, far ahead of similar work produced by the different method obtaining in this country.

Indeed the method of co-operative designing with which the name of Mr. Burnham is associated may prove to have great significance as a step forward in architectural development. When we reflect that all the great masterpieces of antiquity and of the mediæval period are the outcome of collective or co-operative activity, and that the result of such activity was largely impersonal—the expression of the necessities of the programme and of the nature of the building rather than of the personality of its designers—we might be inclined to see in the American method simply a modern application of the same system, which in the course of time may lead to the same high standard of results. Although English architects attach great importance to the expression of the individuality of the designer, yet they cannot forget that this point of view is comparatively modern, that the architect whose work could be easily distinguished by individual characteristics from that of his contemporaries only came into existence at the time of the Renaissance, and that the work done since then under this influence has never risen to quite the same high standard of excellence as that which preceded it. Other influences have no doubt to be borne in mind, but the broad fact remains; and when we come to consider that the whole trend of modern life appears to be towards co-operation of one form or another, the student of historical evolution might naturally be tempted to look upon the individualistic tendencies of the last few centuries as a passing phase in the history of architecture from which the Americans are now returning to the impersonal point of view.

However this may be, it seems only probable that, although at the moment the tendency may be towards the production of great critics rather than of great artists, of architects of sound judgment rather than of imaginative insight and delicate sensibilities, this co-operative designing must have a tendency also towards that general community of thought and feeling which is the first essential of a national and living style of architecture.

Anyone who has had the privilege of visiting Mr. Burnham's office cannot fail to have been impressed by the perfection of his administrative methods or to realise how inseparably his name is connected with a co-operative system which has satisfied the immediate necessities of the present, and may, by a continual evolution of method, equally well serve the more exacting requirements of the future.

NOTES.

The Institute Elections. As we anticipated, the elections at the Royal Institute of British Architects have resulted in a victory for the Registrationists. There was an unusually large poll, and a large poll usually indicates that the electorate, particularly in the Provinces, have been stirred up by the organisers of the Registration movement. We do not see any objection to a certain group of men placing their opinions before the electors, although the result may be that the Council for the time being does not represent a large and influential body of opinion which it will be necessary to conciliate before success in Parliament can be secured even in the early stages of the proposed Bill. In any case, and indeed with any corporate body, it is a pity when only one phase of an important issue is placed before the members at election-time. It would be much healthier if the electors had also before them the views of those who are either opposed to the Bill or see its dangers. Canvassing, however, in any shape or form is so distasteful to many members who accept nomination for a seat on the Council that there has been apparently no attempt to organise the very formidable body of opinion that is opposed to Registration. There are many members who are indifferent to the issue; while there are others who regard the success of Registration as so remote as not to be worth troubling about. So far as we are informed, complete Registration exists only in three European countries—Italy, Spain, and Denmark; not very notable examples perhaps of the vitality of modern architecture. The new Council will no doubt receive before the end of this year the Report of the recently-formed Registration Committee, and will then be in a better position to proceed to take action in Parliament. If the Bill is thrown out, and if the discussion in Parliament provides no reasonable grounds for believing that an Act will ever come into operation, the Institute action will have, at any rate, cleared the air of much false optimism.

The Piccadilly Blunder.

THE opinion is being held more and more widely that the completion of Denman House as at present arranged should not be allowed. As the work is in progress, the necessity for action is urgent. We have referred often and vigorously to the architectural incongruity which is almost upon us, and which if it is completed and until it is taken down will be another blot on London. (We do not refer to the new wing itself, but to its relation to the whole structure.) Municipally speaking, if we may use Lord Rosebery's phrase, the authorities seem to be powerless, and the artistic crime is greater because it is being committed on Crown land. We are sure that if our suggestion of last week were to be carried out, namely, that a Conference be held by the public bodies of London, including officials from the Woods and Forests and some Members of Parliament, the meeting could cause such a pronouncement of censure to be circulated that the public would be awakened effectually before the scaffolding is removed from the building in dispute. The London County Council, we believe, contributed a large sum of money towards the cost of the new Gaiety Theatre. If there is a question of finance in the present situation, the authorities at Spring-gardens would be interpreting the wishes of the ratepayers again by guaranteeing any funds which may be needed to secure the satisfactory completion of the hotel.

Action by the London Society.

THE Earl of Plymouth, Sir Aston Webb, and Mr. D. Barclay Niven, on behalf of the newly-founded London Society, have written to the *Times* protesting against the destined appearance of this Piccadilly façade, and they proclaim the necessity "for some general control over the architecture of our streets." If Sir William Richmond's suggestion to the London County Council of an "Improvements Reference Committee" had been adopted, such a controlling body would have been constituted years ago. The need for municipal machinery for purposes of restraint and arbitration in architectural matters has been proved many times, and if it is secured through the efforts of the London Society that body will have justified its existence at a bound. We hope that the Executive Committee will be able to bring the matter before Parliament, and that the public support which they need to strengthen their hands will be forthcoming.

South African War Memorial.

THE sheets of the book containing the names of those who fell in the South African War, which is to be placed in Cape Town Cathedral, have been on exhibition for a time in one of the galleries of the Victoria and Albert Museum. Since the volume is to consist of some 440 folio pages, the labour involved in its planning and execution has been enormous. It is, therefore, matter for congratulation that it has been undertaken by artists of such standing as Mr. Graily Hewitt, who has been responsible for the arrangement, the writing, and the gilding of the book; and Mr. Allan F. Vigers, who has designed and carried out the illuminated decorations. Mr. Graily Hewitt is one of our foremost scribes, and he has produced a really satisfactory piece of work. He has chosen a clear and beautiful Italian script and has rendered it admirably, with great delicacy and taste. His headings, in large Roman capitals, are masterly pieces of lettering, displaying ingenuity unmarred by any eccentricities. He knows just when to prolong, say, the tail of a Q, or to give it an extra twirl, and how, by skilful management, to compress an awkwardly long word without making it illegible. Mr. Vigers's task has, perhaps, been somewhat more difficult. His colours at first sight strike us as rather crude, and we are surprised to find so few heraldic devices in the adornment of pages commemorating soldiers. But the colours, we learn, have been specially chosen to withstand the climate of Cape Town, and the idea of introducing regimental badges, etc., has been considered and rejected. Their place among the scrollery of the decorations has been taken by birds, beasts, and flowers selected on account of their connexion with the country whence the various regiments are drawn (the thistle and duck for the Gordon Highlanders, hops and an owl for the Buffs, an elephant for the Ceylon contingent, and so forth). It is impossible, of course, to refer to the ornamentation in detail, but we may mention in passing the right-hand member of the title-page, composed of the words of the dedication of the book in gold capitals on a background of grey dots twined about with a delicate design of red strawberries, green leaves, and blue flowers. This recalls, by its delicacy and elaboration, some intricate Oriental work. The heading of the index, too, in different coloured letters on a light scrollwork ground, whose predominant tone varies to harmonise with them, is a very dainty piece of ornament.

Wandsworth Council Baths Committee.

WE regret that there still remains some confusion as to the objects of competition and the functions of an assessor, on what Mr. Renshaw called "such an up-to-date body as the Wandsworth Borough Council." The circumstances surrounding the initiation of a scheme for baths, etc., in Balham, has been brought to our notice. At the instigation of strong petitions a central but back-street site had been secured, and the Baths Committee reported that in the interests of "public health, education, and the general well-being of the inhabitants" they thought the proposed expenditure justifiable. The Council agreed, after discussion, to the competition principle, only to find, within itself, vigorous opposition to the appointment of an assessor, on the ground that such a person might override the views of the Committee. An alderman then remarked that "the idea of the assessor is to advise the Committee, but if the Council think we are competent to do without that advice, I do not think we will press the point." And so accordingly it was not pressed. In the ensuing discussion of cost, consisting, in great part, in the statement of widely varied estimates, it came out that many Councillors thought that as the building was to be in a back street it should be of the cheapest possible description—a sufficiently poor ideal to have for guide. Finally the question of assessor and competition was raised all over again, and the whole matter referred back to the Committee. So they have got no farther. Nor will they to any purpose while such confusion reigns. And it may end in their own surveyor, with the assistance of extra draughtsmen, undertaking the designs, apparently on the ground that there will be no danger of his putting any architecture into it—which is hardly fair even to the surveyor. Surely the result of a competition is to obtain, at a ridiculously low cost, a great variety of the best architectural advice, and the function of an assessor, as one who really knows, to choose the best design for their purpose? The Council can guard itself as to cost.

Street Name-Plates.

OUR opinion on the subject of street labels remains unchanged; uniformity is not so important as legibility. The Conference at the Royal Institute of British Architects, under the Chairmanship of Mr. Ernest Newton, elicited a verdict in favour of the plain cast-iron plate with raised letters in old Roman type. Brightness and boldness are obtained by the lettered tiles used on the Mawdley-buildings in the Waterloo-road, on the Fletcher-buildings near Bow-street, on the dwellings on the Millbank Estate, and elsewhere; but such a form of direction is unsuitable in many cases. We should like to suggest that when the representatives of local authorities meet again to consider how to do this work adequately the allied subject of street nomenclature should be on the agenda. Names that have outlived their original significance, such as Exhibition-road and Lavender-hill, may remain with advantage to prompt the memory, and it may be unwise to attempt the revision to any extent of inscriptions which are established, though inappropriate. But more severe editing of proposed street names, especially in suburban districts, would be beneficial. It would prevent the christening of a mean street with the name of a great art collector and similar inconsistencies.

"Rising Early in the Morning."

MR. ANTHONY HOPE HAWKINS once confessed that for years he had read advertisements of appointments, but had never found himself eligible for a vacant post. Indeed, most conscientious persons who have studied the various requirements have felt that their qualifications, if any, fall short of the desired number or standard. An opportunity occurs now which will appeal to all diffident and self-analysing candidates for advancement. A principal is required for a School of Arts and Crafts, which shall be nameless. "The School includes in its prospectus the work of a School of Art in accordance with the Regulations of the Board of Education, together with Building Subjects (including Building Construction, Builders' Quantities, Wood-Carving, Plumber's Work, Gasfitting, Ironwork, Stone-Cutting, Carpentry and Joinery, etc.); Metalwork Subjects (including Forge Work, Silversmiths' Work, Jewellery and Enamelling, etc.); Applied Mechanics, Magnetism and Electricity, Machine Construction, Art Needlework, Dressmaking,

L

etc." Day and Evening Classes have to be directed, and the salary offered is 300*l.* a year! In these days of enterprising versatility, when the man of modest attainments is outwitted, there should be many to look with approval upon this offer of a sinecure. We can imagine the successful candidate pursuing his congenial work. The morning, perhaps, will be devoted to supervising the wiping of a joint by the students of plumbing, in demonstrating to embryo village blacksmiths the uses of hammer and anvil, and to experiments in concrete reinforcement. In the afternoon the Director will dissect a refractory magneto and transmit the skill of a Nelson Dawson or an Alexander Fisher to those composing the Enamelling Class; and in the cool of the evening the still alert Head will criticise the stitchwork of an embroidered altar-cloth or the cut of a skirt in the Dress Department. And the recreation of the successful applicant! He will be at least a plus man at golf or the marksman of his company.

PICTURE EXHIBITIONS.

THE Goupil Gallery Summer Exhibition is usually in some sort complementary to the exhibition of the New English Art Club; a certain group of the same men is represented at each. A few of the most important subjects at the Goupil Gallery deal with still life, and probably the most notable of these are the "Bowl of Roses" by the late Mr. W. Christian Symons and the piscatorial arrangement by Ribot. These still-life pictures so often wear the air of set studies (as, for instance, in the two pictures of Mr. Wm. Nicholson, "Tulips" and "Orchids") that the quality of Mr. Symons's roses is all the more striking; just arrangement or technical skill, which the picture eminently possesses, is the last thing that occurs to one in looking at the rich leaves of these full-blown, luscious buds. Mr. Nicholson's two subjects are experiments in a black background, and they are both effective. It is curious that the adaptability to decorative purposes of black pigment is not more generally realised by painters. The "Deserted Quarry," by Mr. Wilson Steer, a harmony in red, greens, and yellows, is one of his best pictures; and Mr. Frank Brangwyn in the Venetian "Custom House" employs his bold and rugged methods with greater and more careful elaboration than is quite usual with him. The decorative constructive quality, whether in form or colour, of this work is remarkable even for Mr. Brangwyn. Mr. Augustus John shows two pictures, "Two Children under an Olive-Tree" and "On the Cliff," as well as numerous drawings, which are all perhaps more curious than interesting—the eccentricities or affectations of a talent, typical of the modern spirit in many of its various phases, even in those which to the plain man appear to be the expressions of wilful moods, the moods of a perverse child. Charles Conder was also wilful; but he had not the technical versatility of Mr. John, and he was always consistent to his feeling for style. "La Belle Antonia" is (apart from his decoration of fans) one of his most typical works. The chief attraction of the exhibition is the "Diana" of Matthew Maris and Bellanger. What part Bellanger played in its creation we do not happen to know; but the picture does not suggest a composite work; the figure and the background—Diana is emerging from the forest—equally express the poetic charm of mythological romance. The title was probably an afterthought; but, in any case, this is no obvious placing of the nude model in an unfamiliar *décor*; the figure is an idealised child of its surroundings.

The brilliant drawings in pastel of Léon Lhermitte at Messrs. Tooth's have been followed by the exhibition of the Pastel Society at the galleries of the Institute of Painters. Lhermitte is, of course, an acknowledged master of this medium, and, in view of its growing popularity, we would like to see him represented in one of the National collections. A pastel drawing by Lhermitte is unmistakably a pastel drawing; one could not mistake it for a work in any other material, although his pictures are wrought to the finest point of technical nicety. Many of the exhibitors at the Pastel Society strive after the effect proper to water-colours or oil painting, which is an obvious misuse of the means at their command. Effects can be obtained in pastel which are in a measure denied any other expressions in colour. The three galleries in Piccadilly are so well occupied, and contain so many interesting works, that the practice of the art would seem to be gaining ground. The drawing by Miss Pelling-Hall in the first gallery, "Morning Sun in the Highlands," is not perhaps a direct transcript from Nature, but, what is perhaps more interesting, it shows a certain understanding of the prismatic value of colours that is to be found in some of the French impressionists. This and other "luminous fancies" on the walls indicate that many modern painters who strive above everything by the use of pure colours only to depict objects in brilliant, vibrating light and atmosphere, might find their happiest medium in pastel.

The pictures at the Latin-British Exhibition are a little disappointing. Many of the best artists of the various countries are represented, but, with rare exceptions, they have not sent very characteristic work. The Italian artists provide one of the exceptions. When one heard recently of the Divisionists one imagined that the Futurist movement had been interred prematurely, or that "new movements" in Italy were toppling over each other. But the Divisionist movement is no new thing; it goes back, according to some notes in the catalogue, to 1886; but in France it goes back much farther. We have already referred to the artist's "decomposition of colours" in our brief note on the exhibition of the Pastel Society. The methods of the Italian Divisionists are *au fond* pretty much the same as those of which Claude Monet was one of the earliest, if not the first exponent. Italian Art at the White City is represented by Fornara, Prada, Cesare Magi, the celebrated painter of religious subjects, Gaetano Previati, and other artists. Previati "in the pursuit of light found Divisionism," we are told; he is a mystic and seeks his subjects only in spiritual conceptions, which he portrays in whirling lines of pure colour. Previati in technique gets away from the classical treatment of religious subjects; he is extremely "modern," but his mysticism does not carry him beyond the traditional realisation of the procession to Golgotha. The higher spiritual view to-day would probably see more of triumph than tragedy in this splendid catastrophe.

LIGHTING OF THE HOUSE OF COMMONS.

A report by Mr. E. Treacher Collins, F.R.C.S., upon proposals for lighting the House of Commons has just been officially issued. He and Dr. Parkes inspected the present installation of gas in the debating chamber, which is laid in the roof, and is supplemented with lamps for the back benches. The contemplated installation comprises groups of three metallic filament incandescent lamps with holophane globes and placed over square panes of ground glass, amber-tinted, so as to cut off the ultra-violet rays that irritate the eyes. Mr. Treacher Collins observes that, whereas the gas lighting by lamps on the pillars in front of the back benches is four fifths of one candle-foot, the same amount or more, as he should think desirable, can be obtained with the electrical lighting, and from a better situation, namely, behind the members. He found, too, that the dispersion of light by the holophane globes produced an illumination more uniformly diffused, and more free from glittering points, when the squares in the roof were lighted by electricity instead of gas.

ANNUAL ELECTIONS.

AT the meeting of the Royal Institute of British Architects on Monday, the following elections were announced:—

As *President*.—Professor Reginald Blomfield.

Vice-Presidents.—Messrs. A. W. S. Cross; E. Guy Dawber; George Hubbard; and Ernest Newton.

Past Presidents.—Sir Ernest George and Mr. Leonard Stokes.

Hon. Secretary.—Mr. H. T. Hare.

Representatives of Allied Societies.—C. E. Bateman, Birmingham Architectural Association; J. Brooke, Manchester Society of Architects; A. Clyne, Aberdeen Society of Architects; J. A. Gotch, Northamptonshire Association of Architects; G. Hastwell Grayson, Liverpool Architectural Society; W. Milburn, Northern Architectural Association; A. N. Paterson, Glasgow Institute of Architects; E. R. E. Sutton, Nottingham Architectural Society; A. Lorne Campbell, Edinburgh Architectural Association.

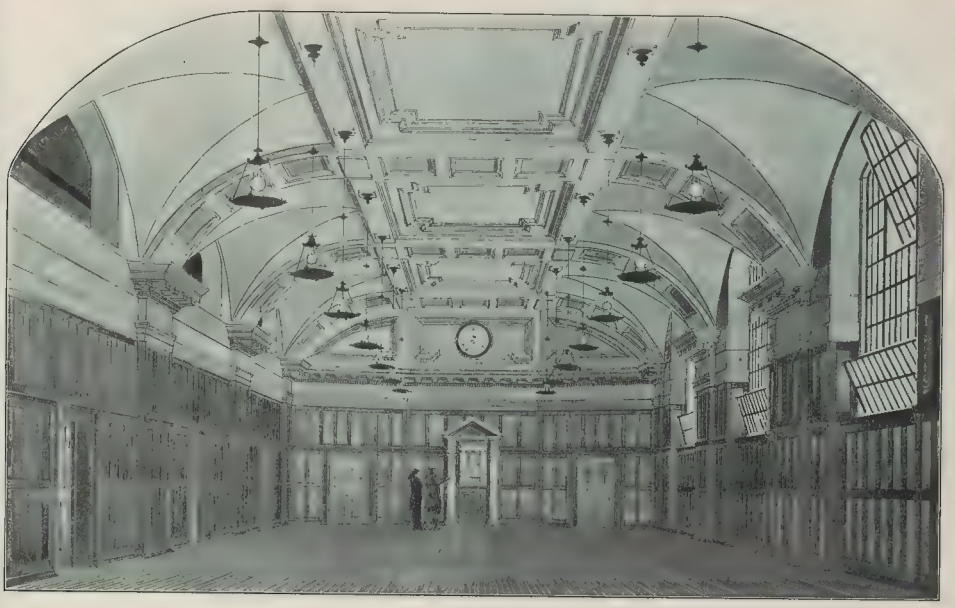
As *Members of Council*.—A. W. Brewill; Max Clarke; T. E. Cooper; William Dunn; F. R. Farrow; W. Flockhart; W. A. Forsyth; J. S. Gibson; H. V. Lanchester; C. S. Peach; Sydney Perks; S. P. Pick; C. H. B. Quennell; E. A. Rickards; W. J. Tapper; W. H. White; E. W. Wimperis; William Woodward.

As *Associate Members of Council*.—K. Gammell; S. K. Greenslade; E. Gunn; A. E. Munby; Septimus Warwick; A. N. Wilson.

As *Representative of the Architectural Association*.—G. C. Horsley.

As *Auditors*.—J. Hudson; W. H. Burt.

The *Art Standing Committee* was elected as follows:—*Fellows*: E. G. Dawber; W. Flockhart; H. T. Hare; G. C. Horsley; T. G. Lucas; Ernest Newton; E. A. Rickards; J. W. Simpson; H. H. Statham; W. J. Tapper. *Associates*: O. M. Ayrton; M. J. Dawson; S. K. Greenslade; J. J. Joass; Septimus Warwick; A. N. Wilson.



The *Literature Standing Committee* was elected as follows:—*Fellows*: J. A. Gotch; W. Curtis Green; D. B. Niven; G. H. F. Prynne; F. M. Simpson; R. Phené Spiers; C. S. Spooner; C. H. Townsend; E. P. Warren; Paul Waterhouse. *Associates*: Walter Millard; H. Passmore; C. W. Smith; Arthur Stratton; W. H. Ward; H. W. Wills.

The *Practice Standing Committee*.—*Fellows*: W. Cave; Max Clarke; A. W. S. Cross; George Hubbard; C. Stanley Peach; Sydney Perks; H. D. Searles-Wood; A. Saxon Snell; W. H. White; William Woodward. *Associates*: H. W. Cubitt; K. Gammell; E. Greenop; J. N. Horsfield; C. E. Hutchinson; H. Shepherd.

The *Science Standing Committee*.—*Fellows*: H. P. Adams; E. R. Barrow; W. E. V. Crompton; B. J. Dicksee; W. Dunn; F. R. Farrow; E. Flint; H. Gilbert; G. Hornblower; R. Elsey Smith. *Associates*: R. J. Angel; W. R. Davidge; G. L. Elkington; J. E. Franck; C. J. Marshall; A. E. Munby; H. A. Saul; D. L. Solomon; E. W. Wonnacott; M. E. A. Young.

THE BOARD OF ARCHITECTURAL EDUCATION.

The Board of Architectural Education of the Royal Institute of British Architects announce that the designs submitted by the following students, who are qualifying for the Final Examination, have been approved:—Subject I. (b), "A Terrace of Five House," Mr. E. H. Gibson; Subject II. (b), "A Cloister with External Entrance Gateway or Tower to a Collegiate Building," Mr. E. H. Gibson and Mr. Wm. Voelkel.

Brighton, Hove, and Sussex Grammar School: The Assembly Hall.
Mr. S. B. Russell, F.R.I.B.A., Architect.

BRIGHTON, HOVE, AND SUSSEX GRAMMAR SCHOOL.

THE foundation-stone of this building was laid with full Masonic honours by the Duke of Richmond and Gordon, as Provincial Grand Master of Sussex, on the 13th inst.

The silver and enamel trowel used for the ceremony was designed by the architect and made by Mr. James Gibbons.

The building, costing about 20,000*l.*, is being erected by Messrs. Willmott & Sons, of Hitchin and Hornsty, in Kevmer red bricks and Box Ground stone dressings, with Keymer tiles on the roofs, and with Gibbons Steel casements in windows. The floors in ferro-concrete are by Stuart's Granolithic Company, the heating by Messrs. Phillips & Son, and the electric light wiring by Gooding, of Brighton.

The architect is Mr. S. B. Russell, F.R.I.B.A., and the clerk of works Mr. E. Taylor.

EXHIBITION OF MURAL DECORATION AT CROSBY HALL.

UPON the walls of the rebuilt Crosby Hall, situated on the Chelsea Embankment, in the Hall proper, the crypt, and an annexe, is being exhibited until June 22 an interesting collection of mural painting designs. This exhibition—which has been carefully catalogued—may be divided into three groups. Firstly, that which is retrospective in the subject of mural painting since its revival in England and France, illustrated as it is by cartoons and reproductions; secondly, that group which also so illustrated deals with the work executed in our day in schools, libraries, and other institutions—this division includes also some of the pictures and mural designs that are produced for hanging in schools; and, lastly, that group around which perhaps the greater interest centres, composed as it is of competitive designs for the mural decoration of wall spaces of buildings still in course of erection or but recently completed.

It is hoped that by the close of the exhibition the awards will have been made. We take this opportunity to offer our congratulations both to the architects on the one hand and the private donors on the other who have come forward in such ready response to the appeal of the Organising Committee not only to place wall spaces at their disposal, but also funds, supplementing those the Society have already in hand for their execution by the selected artists. We trust that the public spirit here shown by these gentlemen, co-operating with the judicial awards shortly to be made by the Selection Committee, will bear a practical and beneficial result in the adornment of our buildings. When on glancing down the list of the Selection Committee we find included such names as Mr. Charles Aitkin, Professor Brown, Mr. A. H. Christie, Mr. Walter Crane, Professor Geddes, Professor Lethaby, Professor Moira, Mr. D. S. MacColl, Mr. Halsey Ricardo, Mr. John S. Sargent, R.A., Mr. W. Strang, A.R.A., and Mr. Henry Tonks, we have little doubt that the works elected for execution will be worthy of acceptance.

Ceremonial Trowel: Brighton, Hove, and Sussex Grammar School.

Nor must we overlook the fact that this "organised opportunity"—for which many an artist has asked in vain—has not been allowed to pass by those men who have for so long cried out, "Give us the walls and we will paint." For so we judge by the amount of work sent in by those artists. We leave our criticisms of their individual work to follow.

The Society cannot but feel that the experiment—for such it is—is appreciated; and we wish to place on record our appreciation of this most praiseworthy attempt to revive once more in our midst this national art, so long time sleeping.

It has been well said—we think rightly so—that the painter who has grown old in the service of canvas and easel painting should better "work out his own salvation" on that canvas than start anew upon a plaster surface; a man so trained cannot sufficiently rejuvenate his ideas or throw aside with requisite freedom the sophistications that have unconsciously grown up and around him and his experiences. The promoters of this exhibition would seem to have recognised this fact in so offering their advisory remarks and "general considerations or hints for the younger competitors."

The broad lines upon which the whole scheme has been drawn up is tempered, not with a host of binding and unnecessary conditions, but with a hope that the workers competing shall have sympathy with their work. So we find it stated that "wall paintings should appear to be part of a wall and of a room—that is to say, it ought to be possible, at times when one is not looking at them expressly, to regard them as a background or setting. Therefore they should not be too insistent and selfish in their claim on the attention; on the other hand, they ought to be clear and easy to read from the opposite side of the room, not requiring worry and search for their meaning."

And, again, in reference to the relation of colour to colour, that "the prevailing tint and tone of the room will set the key, and the endless colours and tones of those colours possible in a scene, will be reduced to a limited group,

as in a good carpet." "Just as the general effect should not be too assertive for the uses of the room, so the style of mural painting should not be aggressively personal . . . public manners require some sacrifice, and a wall painting should be so conceived that it will be possible for another painter to take up the thread alongside."

So, too, we add that the poster-work method is not necessarily a method best suited for mural painting; wall painting calls for a more spiritual rendering of form and matter than any of the accepted "decorative" poster devices can offer as a resultant.

With all the best will in the world many mistakes in the venture and experiment will be made, and it is not surprising to find that even in this initial stage much of the constructional and organic element is wanting in many of the designs. We realise, of course, that full-size cartoons, however accurately drawn, are, after all, but cartoons, and we must hope that the errors we note, as also those that arise through the misconception of the due relation of a subject to its surroundings, will all be remedied by the time that the artist, so chosen, is empowered to begin. However truthful a cartoon may be in design, the limitations that the material of the wall surfaces, the plaster, and the painting mediums do set have yet to dictate to the artist his final means of expression. As experience begets experience, we look forward to the time when the preliminary cartoons will fade into significance as the painter obtains a greater mastery over his materials.

For mural decoration is nothing if not direct; and the more we realise the but limited usefulness in this respect of a coloured drawing the brighter will glow the colour from our walls: our mural decorations will move us the more.

On reviewing generally the works exhibited we commence with those for the decoration of the Lady Chapel, the Church of St. Jude on the Hill, Hampstead Garden Suburb. "Lambeth" (39) shows a quiet and a dignified treatment of the "Nativity," which centres most appropriately around a majestic figure of "Our Lady." Yet the small figures in the foreground, though in harmony with the spirit of adoration that rightly pervades the design, lack somewhat of repose, and we seem unwillingly familiar with their rather set rendering. "Poles Asunder" (41) has certainly a "constructional" design to show, echoing in many respects the strong directness of the church that he would have contain it. Still, by his treatment the mysticism of the subject unfortunately suffers. Both the designs of "Stata" (18) and "Questa" (36) breathe out the sentiment of the subject of the Nativity and exhale the spirit of the inspired truths. Many of the designs shown—and "Questa," with all his beauty of idea, is here included—are apt to get fussy. An insistence of detail is to be deplored when dealing with such large wall surfaces, nor is it recognised sufficiently as yet that the "altar furniture" also requires to be seen, and that it also introduces a scale of detail that cannot be overlooked. "Medicus" (154) has a strong design of kneeling figures with a star-lit sky much in prominence behind, but we feel that designs so treated are too heavy in tone for the chapel, which, it must be remembered, is lit directly only by windows in the north wall.

For the decoration of the "Projected New Building for the Gallery of Modern Art" at Dublin, "Celt 1, 2, and 3" (29) exhibits a vigorous scene of "the meeting of Cuchullin and Emer." This is full of life and colour, and has strong heraldic qualities. More restrained in feeling and suggesting more the poetry of that country are the designs by "Qualis ab Incepto" (23) and "Paint Bender" (24), who show respectively by "The Coming of St Patrick"—the introduction of Christianity to the overthrowing of paganism—and by "The Sons of Tuirean," whose shouts echo back from the green hills. "Every Cloud has a Silver Lining" (30) submits a design, broad in treatment, which is well modelled by the use of high lights and deep shadows. The work by "King Arthur" (32) we refer to generally later on; but, though we recognise the technical ability, we feel that the art displayed is too conscious and too personal a matter for a public and general adaptation that is required.

Messrs. Crosse & Blackwell's Jam and Pickle Factory competition receives several designs. That shown by "What You Will" (92) in the "Making Jam" and "Making Pickles" contains in it the spirit of work, and the introduction of the appliances of manufacture alongside the "raw" goods is as instructive as it is æsthetically beautiful. "Workmen in Factory Yard" (94), by "From Toil He Wins His Spirits Light, etc.," is a good illustration at the scene of exportation.

It is a matter too controversial here to introduce as to whether a scheme of decoration best fitted to ennoble and to revive the flagging energies of the factory-hand should portray the scene in which that "hand" is engaged in, day in and day out, or whether a scheme by which that worker is "drawn out" from his present surroundings—the squalid surroundings mayhap of his factory life—is not the better. To be introduced to a country that has pure air, freshening breezes, a blue sky, and an horizon is worth a great deal. The design shown by "Homo Homini Lupus" (72) brings us thus into that country, and the sentiment is a healthy one. The drawing needs, however, to be strengthened and freed from a prettiness apparent throughout.

The space offered in "The Vestibule of the Middlesex Hospital" has not produced a very high quality of exhibits. "Tyneside's" "In the Country" (82) is bold in its alignment of his figures in the foreground, and shows a pleasing massing of colour and a beauty of line. "Marjoribanks" has a most able design in "Country Air" (88), but we feel that the "distance," if carried out as there shown, would be too worrying in effect. "Summer" (133), by "Spes," has a pretty dancing group, and is accompanied by a delightfully drawn detail. As a whole, however, it is a "book illustration," and does not suggest a mural treatment.

"St. George and the Dragon" is the competition panel offered by the Cable-street School. The design by "Waste Not, Want Not" (26) is direct and full of life. His "St. George" is vigorous, and he has not confused his subject-matter with excess of detail nor overlooked the usefulness of retaining the simple and light "ground." "Boreas" (34) treatment of the same subject is too mediæval to be of direct inspiration for to-day, and it is too full of small detail; yet with all its defects there is a native simplicity which, beyond all sophistication, is a very precious quality. "Fish" (119) shows a rich treatment, but his cartoon hardly bears out the smaller design, which is in itself inclined to be too complicated.

The exhibition, as above mentioned, includes also a large and interesting loan collection of photographs of mural decorations executed and contemplated. With their valuable exposition of the subject, taken together with the interesting competitive work here briefly criticised, surely the atmosphere shall be created for the fostering of this revival. Is it too much to hope that the public will readily, and soon, respond to the claims the movement—as it spreads—makes upon them and their monetary assistance?

The whole movement is yet in its infancy, and there is a large field yet to be covered. The would-be painters must know the composition of the "pigments" and the consistency of the mediums they are to use; it is most essential that they have a wide knowledge of suitable wall surfaces on which to paint and know in turn their composition. A knowledge of the structural parts of the building to be decorated, a recognition of the individual units which combined give right proportion to the whole, must be theirs. Materials, we repeat, do impose limitations, and often the worth of a painting is the result of that imposition. Yet deeper lies the root of the whole matter; wall painting at present is on the walls of the few because it is not in the minds of the many, and wall painting in England cannot rightly come into its own while it is considered by the nation to be a luxury, seen only upon the walls of a few rich people and occasionally on the walls of a public building. The wall paintings of the present day can only be of real value to the extent in which they reflect the creed of the painter and the beliefs of the nation. The excellence of the paintings and their lasting good lie not in the "talent" of the man or in his technical ability to reproduce another's thoughts in colour, but solely in proportion to the degree of his vitality and masculinity, the largeness of his conception, the firmness of his mental grasp, the long-sightedness of his mental vision, his simplicity, born of self-abnegation for the common weal, his courage and his spirit of adventure that would as willingly beat down the doors of hell as scale the walls of heaven.

The call must come from a people for whom wall painting is a necessity—a call as unconscious and spontaneous as it should be definite.

The nation will only breed its artists and call for their work when the nation realises that it has a soul to save. The whole question of wall painting and its present position to-day is bound up in and forms part of the march of the nation. And it is only logical and more optimistic than pessimistic to suppose that any result worth having can only spring from such a slow-setting foundation.

BOOKS.

The Works of Man. By LISLE MARCH PHILLIPPS. (Duckworth. 1911.)

THIS is, to our mind, a collection of critical writing of considerable importance. To transcribe from the author's Introduction: The aim of the book is easily explained. The author has made no attempt to speak of art from the æsthetic standpoint, as a realisation of the beautiful, and as controlled by principles which have that realisation for their object. His desire has been to confine himself to the consideration of art as an expression of human life and character. Selecting some of the great periods, or creative epochs in the art of the world, he has endeavoured to deduce from them the distinguishing qualities, limitations, and point of view of the races which produced them. The volume is a collection of articles much of the substance of which has appeared in the *Edinburgh* and *Contemporary Reviews*. It contains chapters on the Egyptians, the Greeks, the Gothic, and the Renaissance, with others of more general critical outlook, together with one, closely illustrative of the writer's theme, called "The Art of an Aristocracy," on the style called Louis Seize. There are some matters of detail—his animadversions on the shape of the Egyptian column, for instance—which we would combat. But the book, as a whole, defines an idea which is really so obvious as to be startling—especially, we imagine, to those whom we are accustomed to regard as our teachers. Mr. Reginald Blomfield, A.R.A., Mr. T. G. Jackson, R.A., and Professor F. M. Simpson particularly are taken to task, and it would be exceedingly interesting to hear what these gentlemen would say to the author's criticism of their attitude as expressed or implied in his book. The volume contains stuff which should be in the wallet of every vagrant critic. Such a one, in the wilderness, might even make of it his staff and sole support. No one really interested in architecture should need to read it, but—nearly every one does so need. For those not conscious that our architecture is but precariously grafted on to the civilisation of our time it can do nothing; but for those who feel that the dry considerations of which nearly all contemporary criticism is composed are not everything, or even a beginning, if discussions of art and architecture are to possess any vitality, there is all to justify and much to inspirit and sustain. The author's constant endeavour is to show that the various forms and emotional combinations—what are called the styles—of the tale of whose successive growth and decay the history of architecture is composed, do not draw their sustenance from, and have their origin in, the consideration of abstractions, such as "proportion," "repose," "strength," and the like, which are so often held up as our guidance. He proves conclusively for us, did we need to be convinced, that the mainspring of the life of each style is to be sought in the action of racial character upon the conditions, material and cultural, through which the race must gain expression, and that their architecture is just that expression. He accomplishes his task, not really a difficult one, we think, though we have nowhere seen it so thoroughly performed, with the skill of a practised writer—the knowledge of a man who has seen, rather than merely read about, the world of which he writes. If anyone who reads this notice is ever asked by a layman, as members of the profession so often are, for a book which shall tell him something, not technical, about architecture itself, this is the book to recommend. We propose shortly to publish a speculative article, in which Mr. L. March Phillipps's conclusions will be applied.

Keystones of Building. By MR. F. INIGO THOMAS. (London and New York: John Lane. 8vo. 109 pp. 2s. 6d.)

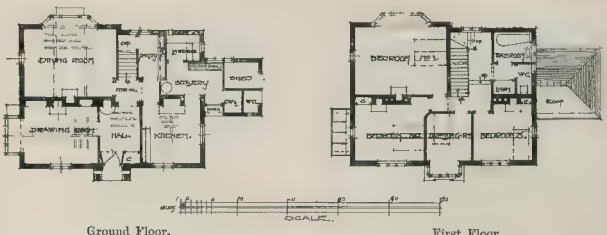
THIS little book is primarily intended for the building employer, and gives him concisely and clearly an insight as to the architect's point of view. It might be entitled "How to Treat Your Architect," as it points out the many ways in which a client may, although actuated by the best intentions, give his adviser a very bad time.

Needless to say, Mr. Thomas's review of the relationship between architect and client is of little less value to the former than to the latter. It is fully as important for the architect to appreciate the employer's point of view as for the latter to comprehend the architectural aspect, and we can cordially recommend this book, being satisfied that when both architect and client have read and digested its contents the chances of any difficulty or disagreement arising between them are reduced to a minimum.

The processes connected with the building of a country house are examined from start to finish, and the questions likely to arise at every step are reviewed in a brief but incisive fashion. The problems before the employer are fairly and sympathetically dealt with, while at the same time he is given some emphatic hints as to where he may possibly fail in his attitude towards the legitimate claims of his architect.

Butterworth's Workmen's Compensation Cases. Vol. V. Quarterly Advance Sheets; Part II. 1912. Edited by DOUGLAS KNOCKER, Barrister-at-Law. (London: Butterworth & Co. 1912. Pp. 264. 7s. 6d.)

NINE cases in the House of Lords and close on sixty in the Court of Appeal is not a bad record of litigation in two months—March and April, 1912—to have arisen under even a modern Act of Parliament, yet this is approximately the number of cases which are collected in Part II. of the quarterly advance sheets of this well-known set of reports. Modern legislation, almost colloquial in its terms, may save the time of an overworked Parliament, but it occupies the judges, and the law comes to be settled out of the pocket of the private litigant. Questions under the Workmen's Compensation Act, however, can be settled by the Courts, and eventually therefore it is to be hoped that the cases will form the basis of a code which will come to be understood and litigation will be diminished. Parliament nowadays shows a tendency to substitute private hearings before officials for the publicity of the Courts, as is the case under the Finance Act, and then the position of the citizen is even worse, as no decision forms a binding guide to the interpretation of statutes, and the same blunder may be made or the same injustice be perpetrated over and over again.



If the cases under the Workmen's Compensation Act be "legion" in number, the public are, nevertheless, afforded every assistance to a knowledge of the law by the reports under review. Each of these advance sheets contains a Table of Cases, a Digest, and an Index to the part itself as well as to its predecessors, and these parts take final shape in an annual volume under distinguished editorship.

The West Country: Somerset, Dorset, Devon, and Cornwall. Edited by PRESCOTT ROW and A. H. ANDERSON. (London: The Homeland Association, Ltd. 1s. net.)

THIS is the 1912 edition of an excellent guide to the West Country, comprising "where to stay, what to see, and where to live," and including special articles on golf, motoring, and fresh-water angling. In addition to some useful practical notes upon West-Country towns, villages, and districts, alphabetically arranged, the book contains some good illustrations and several sketch maps. Altogether the volume is an admirable and handy little work.

Social Guide. Edited by MRS. HUGH ADAMS and MISS EDITH A. BROWNE. (London: Adam and Charles Black.)

AS ITS title implies, this is a guide for those who are desirous of joining in what have become recognised as social functions. A very full diary is given of the events of the year, including all the great sports meetings as well as the more exclusive society gatherings. The information is not confined to doings in this country, but details are given of the "seasons" in Egypt, the Riviera, India, etc. Those possessed of the leisure and means to enable them to take a part in such gatherings will find the book of great service.

BOOK RECEIVED.

HUNT'S LAW OF BOUNDARIES, WALLS, AND FENCES. By R. G. Nicholson Combe, M.A., LL.M. (London: Butterworth & Co.)

HOUSES NEAR HATFIELD, HERTS.

THIS group of houses is being built on the Roestock Rise Estate about one mile from Hatfield. They are of Georgian character, and are executed in red-brick hollow walls, with red-tiled roof and white painted windows, etc. The accommodation consists on the ground floor of entrance hall; in the larger centre house this is provided with a fireplace, drawing-room, and dining-room, both having bay windows, china pantry, kitchen, scullery, and offices. On the first floor are three bedrooms, dressing-room, bathroom, lavatory, and linen closet. On the second floor two of the houses have a large room, arranged to take a small billiard-table, bedroom, and box and cistern-room, while the centre house has three bedrooms, etc.

The contractor is Mr. W. J. Richardson, of Park-street, Hatfield, and the architects are Messrs. Geoffry Lucas and Arthur Lodge, of Hart-street, Bloomsbury-square, W.C.

ARCHITECTURAL SOCIETIES.

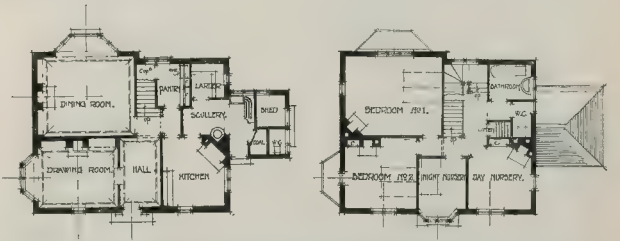
The York and Yorkshire Architectural Society.

Mr. H. E. Henderson, who has been for some time Hon. Secretary of the York and Yorkshire Architectural Society, and who is leaving for Nairobi, British East Africa, was entertained to dinner in the Windmill Hotel recently by the members of the Association, to which he had rendered many valuable services. Mr. A. B. Burleigh, President, presided, and he was supported by nearly forty members of the Association.

During the evening the Chairman presented Mr. Henderson with a suit-case from the members of the Association, and referred in eulogistic terms to the work which he had done as their Hon. Secretary. They wished him every success in his future career, and they could assure him that they would always retain in their hearts happy recollections of their association with Mr. Henderson.

Mr. Henderson suitably replied, and said that in the new sphere to which he was going he would always look back with pleasure to the many pleasant days he had spent in York and the many friends he had left behind. He thanked them for the hospitality which they had shown him and for the gift which they had presented to him.

A general meeting of the Society was held on June 4, when Mr. H. E. Henderson formally tendered his resignation, which was received with regret.



On the proposition of Mr. G. Benson, A.R.I.B.A., seconded by Mr. A. B. Burleigh, Lic.R.I.B.A., Mr. C. M. B. Hinderer was unanimously elected as Hon. Secretary.

Edinburgh Architectural Association.

A party of over thirty of the members of Edinburgh Architectural Association visited Yester House, Gifford, and the old Castle of Yester on Saturday last. The old castle was visited first, and the Goblin Hall, which is alluded to in Canto Third of "Marmion," and is still in a good state of preservation, was viewed with much interest. The mansion-house of Yester stands among finely-wooded grounds near the left bank of Gifford Water, and was built by Adam about the close of the XVIIIth century, but has been greatly altered since then. The public rooms were inspected, and the family portraits. The gardens were afterwards visited.

Architectural Association of Ireland.

A meeting of this Association was held recently at No. 15, South Frederick-lane, the President, Mr. Page L. Dickenson, M.R.I.A.I., in the chair. The minutes of the previous meeting having been read and signed, the President declared the result of the ballot for officers for the ensuing session as follows: President, Mr. George L. O'Connor, M.R.I.A.I.; Vice-Presidents, Messrs. A. M. Reid and F. Sparrow; Committee, Messrs. P. L. Dickenson, N. G. Leask, A. G. C. Millar, H. J. Lundy, C. H. Mitchell, J. E. Burke, R. O'Brien Smyth, J. M. Mitchell, and L. Gieron; Hon. Treasurers,

Ground Floor. First Floor.

Roestock Rise Estate, Hatfield: Plans of End Houses.

Messrs. Geoffry Lucas, F.R.I.B.A., & Arthur Lodge, A.R.I.B.A., Architects.

T. F. Strahan; Hon. Librarian, T. L. Cullimore: Hon. Secretaries, H. Auberry and J. J. Robinson.

The report of the past session was read and adopted. It dealt with the strengthened position of the Association during the year, the membership having increased and the meetings and classes having received more appreciation from the members. Two exhibitions of architectural drawings were held, and the work submitted for the various prizes had greatly improved.

The Treasurer's report was adopted on the motion of Mr. J. H. Webb, who expressed satisfaction at the present financial position of the Society.

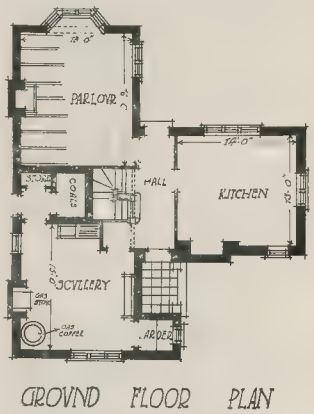
The following prizes were awarded: Institute Prize, Mr. A. W. Dixon; Class of Design, first, Mr. A. W. Dixon; second, Mr. C. D. B. Ward.

The President announced that the annual excursion would be held early in July, the venue being Liverpool, and that Professor Reilly, of the University, had kindly offered to act as cicerone. He then read a brief valedictory address, in which reference was made to the possibilities of social and political changes in this country. It was early yet to estimate the effect of the new school of architecture on the National University, and possibly the Association would ultimately find its greatest use in training the students in art.

A vote of thanks to the outgoing President for his address and for his conduct of the affairs of the Association during his year of office was proposed by Mr. O'Callaghan, seconded by Mr. C. H. Mitchell, and carried with acclamation.

The meeting was then resolved into a special general meeting to consider the revised by-laws. These, with a few minor amendments, were passed unanimously.

On the motion of Mr. Craig, the new committee were directed to consider the desirability of incorporating the Association.



"ISLAND COTTAGE," BEMBRIDGE, ISLE OF WIGHT.

THIS cottage is situated at Lane End, Bembridge, Isle of Wight, overlooking the sea, and is designed as a holiday cottage. The walls are covered with white rough-cast externally, and the whole of the woodwork, both externally and internally, is stained a dark-brown colour, the windows having leaded lights and iron casements. The hall is built with red-brick walls, relieved by tile courses. The kitchen is designed for a dining-room when required, and has a beamed ceiling and red-brick mantelpiece. There are on the chamber floor three bedrooms, bathroom, water-closet, and a heated linen cupboard. The architect is Mr. A. Jessop Hardwick, F.R.I.B.A., of Kingston-on-Thames, the builders being Messrs. Love & Sons, of Bembridge; Messrs. Humphries, Jackson, & Ambler supplying the casements, leaded lights, and special fittings.

BUILDING ACT ANOMALIES.

BY AN ARCHITECT.

YEARS ago, when I commenced practice, I thought I could be certain of being on the safe side in all Building Act questions if I took care to satisfy the District Surveyor. I was confirmed in this view when, on my telling one of those functionaries that I was anxious to conform to his wishes, he replied: "It is not my wishes; it is the Act." (There was only one Act in those days.) But, with more extended experience, I found that, in different districts the surveyors interpreted the same Act in different ways. Then I said to myself: "They cannot all be right, so I am not safe in following any of them. I will read the Act and

"Island Cottage," Bembridge.

form my own interpretation of it." Accordingly I studied the Act, and as fresh Acts were passed I studied them, until now I find myself in more perplexity than when I started.

One question that has puzzled me is: "What is a building?" For example, I thought that, where you have a shop separated from the side entrance and upper part of a house, the shop is a separate building for purposes of the Act; otherwise, why does sect. 5 (20) of the London Building Act, 1894, define a party structure as "a . . . floor or other structure separating vertically or horizontally buildings . . . . approached by distinct staircases or separate entrances from without"? I had a client, Mr. A., who owned two houses side by side, in one of which was a separate shop occupied by a Mr. B. Mr. A. wanted to unite these two houses by forming openings in the party wall above the ground floor, the whole to be for his own occupation, except B.'s shop. Well, of course, I know that buildings cannot, without the consent of the London County Council, be united unless they are wholly in one occupation. But I provided for separating B.'s portion from A.'s vertically by a party wall and horizontally by a party floor. When I had made my drawings I showed them to my friend Quibbles, who is one of the cleverest lawyers in London; and he tells me that there can be no such things as superimposed buildings; that B.'s shop is not a building, but only a tenement, and that consequently the two houses cannot be united without the consent of the Council. He says: "If the shop is a separate building, where is its roof? Where is its open space at the rear 'exclusively belonging thereto'? You have nothing in this Act, as you had in the Act of 1855, to prove that a room or tenement is a building." In vain I attempted to argue about the intention of the Legislature. He says: "You have nothing to do with what they intended; you can deal only with what they did enact." So I must apply to the Council, which is a course involving several weeks' delay. My client cannot wait; I never met a client who could.

Another question that has puzzled me is: "What is a party wall?" For example, my client, Mr. C., has a house, built against a much higher one belonging to a Mr. D. Between these two houses there is but one wall, which rises one story higher than my client's roof. Now, Mr. D. has formed a window in this wall overlooking my client's property. I contend that he has no right to do this, as the wall is a party wall; and in support of my contention I quote sect. 59, which provides that every party wall shall be carried up above the roof of the highest building adjoining to it. But Quibbles says that, in this case, the wall, which stands wholly upon Mr. D.'s land, is a party wall only for that portion of its height or length which is used for the separation of adjoining buildings. He refers me to the definition of a party wall in sect. 5 (16) (*a*), and says that sect. 59 cannot make any portion of the wall party which is not so under the defining clause. Well, then, I cannot compel Mr. D. to brick up his window. But here is another case. I built a studio for my client, Mr. E., one of the best portrait-painters whose works are annually excluded from the Royal Academy Exhibition. I gave him a dormer with a splendid north light, but unfortunately it is within 4 ft. of a party wall. The District Surveyor requires the wall to be carried up 12 in. higher and wider than poor E.'s dormer, which will have the effect of completely blocking his light. I have consulted my friend Quibbles about this, and he says that the wall will have to be carried up "as required by sect. 59." I reminded him of his own opinion in the previous case, and pointed out that the wall, where it rises above the roof, is not used for the separation of adjoining buildings. His reply is that in the previous case the upper part of the wall was the external wall of another building, whereas here it is simply a party wall carried up. Fortunately I can overcome my difficulty by taking down the dormer and reconstructing it of incombustible materials; but I should just like to know if any of my readers can unravel this web of legal contradictions.

No doubt every architect appreciates the importance of carrying up party walls above roofs to prevent the spread of fire from one building to another, and it is in this connexion that I wish to point out an anomaly in the Building Act which, it is to be hoped, will one day be removed by legislation. The anomaly in question arises when contiguous buildings are separated by two walls instead of one, in which case neither wall is required by the Act to be carried up above the roof. What seems to me anomalous also is the rule relating to recesses in party walls. A recess to contain books, for instance, must have a back not less than 13 in. thick to protect the adjoining building from fire, but a recess containing red-hot coals (*i.e.*, a fireplace) need not have a back more than 8½ in. thick. Clients of mine have complained to me of injury to their decorations by heat from a neighbour's fireplace when the brickwork at the back was quite 11 in. thick, if we include the 2 in. firebrick back to the grate. In such cases there was no remedy but by adding brickwork on my client's side of the wall. The greatest danger, of course, arises from kitchen fireplaces; and here I think the law should enforce the provision of a double thickness of brickwork with a ventilated space between

"Island Cottage," Bembridge, Isle of Wight: Front View.

Mr. A. Jessop Hardwick, F.R.I.B.A., Architect.

at the back of every fireplace used for cooking or heating a water supply.

Anomalies arise in certain cases under sect. 12 of the London Building Acts (Amendment) Act, 1905, which requires certain buildings to have means of access to the roof for escape in case of fire. I knew a case in which two contiguous houses had been united by only one opening in the party wall, and that was in the basement story. The houses, being united, were one building for purposes of the Act, and the owners could not be required to provide more than one means of access to the roof. The property was in the hands of trustees, who dared not expend a penny on improvements except under legal compulsion; so they provided a way on to the roof of one house, leaving the occupants of the other in the same danger as before. Under that same Act, is it not also anomalous that, whereas access to the roof must be provided in a building let as offices, to be occupied only by day, no such access is required in a residence where the attic story is crowded with servants in nightly danger of being burnt?

There are anomalies, as it appears to me, in the provisions for payment of fees to District Surveyors. As a professional man I am ashamed to think that my country expects one of my brethren to superintend the construction of overhanging oriel windows for the paltry sum of 5s. per building. I have seen many a building with ten oriel windows, where the surveyor's remuneration was, therefore, at the rate of sixpence for each superintendence of construction. Also, the fees upon complicated alterations to small buildings often appear to me miserably small. On the other hand, the fees upon small alterations to large buildings are, as many of us know, much too high, and are a source of perplexity to builders tendering in competition. It is true that many District Surveyors make considerable reductions in such cases, but it cannot be contended that the system is an equitable one. I was gratified to see that a reform was instituted in Part IV. of the London County Council (General Powers) Act, 1909. Here the fees are on a higher scale than in previous laws, but in the matter of alterations they apply only to the part of the building affected by the work. In some such direction as this I suggest that our Building Acts ought to be amended. T-SQUARE.

GENERAL NEWS.

Professional Announcement.

On and after June 20 the address of Messrs. Cheston & Perkin, architects and surveyors, will be Graham House, 3, Tudor-street, New Bridge-street, E.C. Their telephone number is No. 1854 City.

Mr. Arthur Stratton, F.S.A.

At the meeting of the Society of Antiquaries held on the 6th inst., Mr. Arthur Stratton, A.R.I.B.A., was elected a Fellow. Apart from his educational work at King's College University of London, and elsewhere, Mr. Stratton is known for his contributions to architectural literature.

India's New Capital.

The town-planning experts consulted with regard to the new capital at Delhi have now officially decided against the Durbar site for the permanent capital. They have selected a position in the south-western suburbs of the city, which offers good drainage and a fine prospect. The only objection to it is its distance from the recently selected site of the temporary capital.—*The Times.*

Oxford University and Egyptology.

Mr. Walter Morrison, M.A., Balliol College, has just supplemented his recent gift of 10,000*l.* for the establishment of a professorial pension and with a sum of 10,000*l.* in promotion of the study of Egyptology. A decree will be introduced in Convocation for the establishment and endowment of a Readership with the gift.

Tattershall Castle.

We understand that Mr. William Weir is the architect to whom Lord Curzon of Kedleston has entrusted the direction and superintendence of the restoration work at Tattershall Castle, which will extend to both the inner and outer moats, the reroofing and reflooring of the keep, the reinstatement of the tracery and glazing of the windows, and the replacement of the fireplaces.

Eton Memorial.

The panelling for the central bay of School Hall has now been placed in position. In the centre, above the inscription-panel covering the first stone, is a niche on which rests the marble bust of Queen Victoria presented to the School by Lord Cadogan. On either side are two long panels on which are cut the names and regiments of the 129 Old Etonions who were killed in the South African War. At the sides of the bay are narrow projecting panels enclosing the whole and capped by an enriched cornice and cresting. The work, which is of an elaborate nature, has been carried out in selected Austrian oak by Mr. Herbert Read, of Exeter, from designs by Messrs. L. K. Hall and S. K. Greenslade, the architects to the Memorial Buildings.

Mr. Havard Thomas's "Thyrsis."

We understand that Mr. Max Michaelis, formerly a partner of the firm of Messrs. Wernher, Beit, & Co., has commissioned the artist to execute in bronze his figure of "Thyrsis," whereof the model, in wax, is now exhibited at Burlington House. The bronze statue is intended for the Johannesburg Art Gallery.

A Memorial of the Boer War.

In the Illustration Department of the Victoria and Albert Museum, among examples of ancient MSS., there was shown early in June for a few days the illuminated record of the names of those who died in the South African War, 1899–1902. This work has been written by Mr. Grailly Hewitt, and decorated by Mr. Allan F. Vigers; the pages will be bound by Mr. Douglas Cockerell, and the volume will be placed in the Cathedral at Capetown, on a desk, protected by a grille, executed by Messrs. Omar Ramsden and Alwyn Carr. The whole production will be a fine example of the combination of individual craftsmanship.

The British Fire Prevention Committee.

The Special Commission formed by the British Fire Prevention Committee to study the fire-preventive and fire-service arrangements of Russia returned to London on Monday after visiting St. Petersburg, Moscow, and Warsaw, and attending the International Fire Congress that has been held in the first-named city. The Commission comprised six members. Many works, warehouses, and large buildings were visited, as also the principal fire-stations, waterworks, and other municipal institutions, and an illustrated report will be issued by the British Fire Prevention Committee embodying the results of the Commission's investigations. The work of fire prevention is accorded primary importance in Russia owing to the enormous annual fire loss, stated to be 30,000,000*l.*, and which can be only reduced to any appreciable extent by better building and fire-preventive regulations.

Cambridge University.

Mr. Arnold Mitchell, F.R.I.B.A., architect of the School of Agriculture, has prepared the plans for an addition to that building at a cost of some 12,000*l.* for the fabric, and 3,000*l.* for equipment and fittings, to be defrayed by a Treasury grant from the Development Fund. The extension, nearly 90 ft. in length, will follow the present design. The Drapers' Company have increased their grant towards the building and equipment of the new Laboratory of Experimental Physiology, thus making their total grant in that behalf to amount to 23,500*l.* A site for the buildings is allocated in the Downing College ground, and the Drapers' Company have appointed Mr. T. G. Jackson, R.A., as the architect. The Board of Agricultural Studies will hold on July 9–12 an examination for one "Surveyors' Institution Scholarship," open only to students of the Surveyors' Institution who have not begun residence. The scholarship is tenable for three years, and is of the value of 80*l.* per annum.

British Home for Incurables, Streatham.

The annual Report of the Committee of the British Home and Hospital for Incurables states that 17,525*l.* are subscribed to the Jubilee Building and Pension Funds, and that Mr. E. T. Hall is engaged upon the preparation of plans for the new "Queen Alexandra" wing.

Vandalism or Improvements at Lyme Regis.

A ratepayer of Lyme Regis, in again drawing attention in the columns of the *Times* to the proposed act of vandalism masquerading as a street improvement, to which we have already referred in a previous issue, raises a question which should not be overlooked. "There is a sharp corner," he says, "where Church-street turns into Bridge-street which is concealed from motor drivers approaching from either side." The narrowness of the present approach compels motor-cars to slow down more effectively than any sign, and it is feared that the proposed dividing of this short piece of narrow street will encourage motorists to approach the corner at a higher speed, and so lead to accidents.

Any automatic method of causing traffic to slow down on approaching a danger point is much to be desired, and while the danger point still remains is an advantage not to be lightly thrown away. If the local authorities are convinced that this widening is an absolute necessity, and are determined to remove the old buildings involved, the least they can do is to remove the danger point also. Considering how much old-world features attract the visitors upon whom such towns as Lyme Regis largely depend, their preservation should be a matter of more than ordinary concern to the local authorities. The scheme, however, has been carried by the Borough Council, so any steps to induce them to reconsider the question must be taken immediately.

Commons and Footpaths Preservation Society.

Lord Eversley presided over the monthly meeting of the Commons and Footpaths Preservation Society, held at 25, Victoria-street, Westminster. It was decided to request the Home Secretary to receive a deputation to urge that facilities should be given for the Second Reading of the Society's Rights of Way Bill, which has the support of highway authorities throughout the country. The object of the Bill is to simplify the proof of rights of way by fixing a statutory period of forty years for evidence of user in the case of disputed paths crossing land in limited ownership, and twenty years in other cases. It was stated that the Society was assisting in steps which were being taken to secure the preservation of Leziate Heath, Norfolk, and Hollesley Common, Suffolk, and that 300*l.* was still needed to complete the fund for acquiring Minchinhampton Common, Gloucester, in order that the land might be vested in the National Trust. Advice was also being given in respect of 170 cases of encroachment or obstruction in various parts of the country.

TRIBUNAL OF APPEAL UNDER THE LONDON BUILDING ACT.

AT a sitting of the Tribunal of Appeal under the London Building Act, at the Surveyors' Institution, to consider an application by the London County Council that the Tribunal should state a case for the opinion of the High Court, setting forth the facts and the grounds for their decision in regard to the general lines of building in Wimbledon Park-road and Augustus-road, Mr. Daldy appeared for the County Council, and Mr. Courthope Munro for the London and Westminster Bank.

The case was before the Tribunal on October 27, 1911, and the facts were briefly as follows.—Some years ago the London and Westminster Bank purchased a plot of land in the Wimbledon Park-road at the corner of Augustus-road, with a view to building at some future date. Wimbledon Park-road, from the railway-station to the county boundary, was unbuilt upon, nor was Augustus-road developed. According to the appellant's case, bearing that houses were to be erected in Augustus-road, which would have the effect of fixing the general line of buildings, they commenced to build their bank premises on the corner site. The Superintending Architect subsequently defined the line of building, and for the purpose of doing this in the case of

the Wimbledon Park-road, he took a length of road of about a mile and a half. In the case of Augustus-road he took the line of the houses being erected. The actual result of these two determinations was practically to destroy the bank site, and hence the appeal to the Tribunal. A good deal of evidence was heard, and there was considerable conflict of testimony as to whether the bank building or the houses in Augustus-road were commenced first. In the end the Tribunal confirmed the Superintending Architect's certificate in the Wimbledon Park-road from what were called A to B. In other words, they found that so far as that road was concerned there was no general line beyond the railway-station to the county boundary, thus excluding the bank premises. So far as Augustus-road was concerned, they also confirmed the Superintending Architect's certificate for points A to B, which is to say they found a building line in the road up to the right of way behind the bank premises, but not beyond. This decision excluded the premises of the bank altogether.

Mr. Daldy now asked the Tribunal to state a case on a point of law as to whether the Tribunal were justified in stopping at the point they did in Augustus-road. He contended that by stopping at the point they did the Tribunal had made the small length of Augustus-road, which was the side frontage of the bank, the subject of a general line of building, and had treated it as a "street, part of a street, place, or row of houses." They wanted the High Court to decide whether the Tribunal were entitled so to treat it as a separate street, and if there was any evidence on which they could do it.

Mr. Hudson (Chairman) pointed out that Mr. Daldy was assuming for the purpose of his contention that the Tribunal did treat it as a separate street, but there was nothing in their decision to say that they did so.

Mr. Daldy said it spoke for itself. They wanted to argue that in law it meant a street or part of a street.

Mr. Courthope Munro said his submission was that there was no point of law. It was a question of fact. The Tribunal made two separate orders in the case, and if there was to be a case stated, then it should be as regarded both orders, or otherwise they would be in a hopeless tangle. However important the case might be to the London County Council, yet that did not make it a point of law. The Tribunal was empowered to "confirm, reverse, or vary any order, or make any order they thought fit." In the case before them the Tribunal took the certificate of the Superintending Architect in regard to the Wimbledon Park-road, and they confirmed that order as far as the railway station. Beyond that point to the county boundary the Tribunal said there was no general line of buildings. In the case of Augustus-road the Tribunal also confirmed the Superintending Architect's certificate up to the right of way behind the bank premises, and beyond that said there was no general line of buildings. The Tribunal manifestly had power to do this, and there was no point of law involved.

Mr. Daldy argued that the question of law would be that there was no evidence on which the Tribunal could come to the finding they did. He did not say it was not open to them to treat a long length of road as a separate street, but when it came to a little bit, as in the case of Augustus-road, different considerations arose.

Mr. J. Slater said what Mr. Daldy's contention came to was that they might be right in their decision if the length of the street was long, but wrong if the piece of street was short, although the ground of their decision might be the same.

The Chairman asked if he was right in saying that the point of law, if it was a point of law, arose on this:—(1) Whether the Tribunal was entitled to confirm the Superintending Architect's certificate as between points A and B; and (2) whether the Tribunal was entitled to decide that except as between the said two points there was no general line.

Mr. Daldy assented generally to this proposition.

The Chairman said if there was a point of law the County Council was entitled to ask for a case; but, at the same time, the Tribunal did not want to put on record what purported to be a point of law, but which seemed quite clear. It seemed to him beyond doubt that the Tribunal was entitled to confirm the Architect's certificate.

After further discussion, the Tribunal agreed to state a case in the following terms:—"(*a*) Whether on the facts found by the Tribunal the Tribunal could not lawfully confirm the Superintending Architect's certificates as between the points A and B on the plans annexed to the orders of the Tribunal in Augustus-road and Wimbledon Park-road; and (*b*) whether on the facts found by the Tribunal the Tribunal could not lawfully vary the said certificates by deciding that, except as between the said points, there was no general line of building in Augustus-road between Wimbledon Park-road and Albert-road, and no general line of building in the Wimbledon Park-road between Seymour-road and the county boundary."

Mr. Courthope Munro said his clients felt rather strongly on the matter, as they had already been hung up with regard to that building, and now it looked as if they would be hung up eight or nine months longer.

LAW REPORT.

HIGH COURT OF JUSTICE, CHANCERY DIVISION.
(Before Mr. Justice JOYCE.)

Denman *v.* The Finchley Urban District Council.

THE hearing of the evidence and the arguments of Counsel were concluded in this case last week.

The litigation arose out of the right of plaintiff, Mr. Denman, to connect water-gullies, etc., with the Council's sewer in Clarence-gardens, Dollis Park, and raised an important question to builders and frontagers in the district. Mr. Denman is a builder, and last month sought an injunction to restrain the Council from interfering with his work of joining-up pipes with the sewer in Clarence-gardens. It was then stated that notice had been served upon him under sect. 150 of the Public Health Act, 1875, requiring him to make-up the road. Mr. Denman, being one of the several frontagers, made an arrangement with the other frontagers that he should carry out the work on behalf of all of them. The notice of the Council gave him only six weeks in which to do the work, and when that time had elapsed the work was not completed, the time being quite insufficient. Defendants took up the position that, as the work was not completed within the time, they were entitled to treat the matter as if no notice whatever had, in fact, been given to the plaintiff, and as if his authority to do the work had lapsed. They claimed that they were entitled to do the work themselves and charge the frontagers with the cost of it. The road in question was partly made up, when plaintiff made excavations for the purpose of connecting his surface drains with the sewers. The connexion was, in fact, practically made, and plaintiff contended, if the Council succeeded in sustaining the position they took up in the matter, that the whole of his work done would be destroyed. Plaintiff pleaded that either he should be allowed to make the connexions or the defendant Council.

The result of the controversy was that the Council ultimately agreed to connect up the plaintiff's pipes without prejudice to their legal rights, so that the only issue remaining was, who should pay the costs? To decide the question the matter had to be fully gone into before the Judge.

Mr. Younger, K.C., and Mr. Moritz (instructed by Messrs. Crook, Milnes, & Jones) were Counsel for the plaintiff: Mr. Hughes, K.C., and Mr. Schofield represented the interests of the Council.

Mr. Moritz argued at length that plaintiff had every right to adopt the course he did in requesting the Council to connect up the pipes, and, when they refused, to do the work himself. The Council had not only refused to do the work themselves, or allow the plaintiff, but in addition defendants had held out a threat that if plaintiff persisted in his attitude the Council would not take over the road, however well the work of road-making was done.

Mr. Hughes, on behalf of the Council, put forward three points:—(1) That after the six weeks' time period given in the original notice to plaintiff any licence to interfere with the property (the sewer) of the Council terminated absolutely

(2) That by an arrangement between the parties the notice was abandoned, and any licence given the plaintiff was withdrawn.

(3) Then, assuming that the licence for plaintiff to do the work remained up to a certain date, it was a licence the Council could withdraw, subject to whatever rights the plaintiff had.

The six weeks' period in the notice expired last December, added Counsel, and the parties went on negotiating for months afterwards on the footing that the notice was at an end. In these circumstances the plaintiff was nothing but a trespasser when he broke into the sewer, for he could not justify himself in any way, as there was no licence for him to do it. Therefore, his present action in law was misconceived, and the Council ought to have the costs of this litigation.

Mr. Younger, in reply, submitted that his learned friend's proposition was a very extravagant one when he contended that the notice reserved to the Council the right, after the road had been almost completed, to withdraw the licence from plaintiff, thus rendering valueless the work already expended on the road by the plaintiff, and leaving it in an entirely undrained condition.

His Lordship said it seemed to him that the question he had to determine was this: Was the plaintiff, when the connexion was made on May 4, entitled, as a matter of right, either to make the connexion himself or to have it made? If he was entitled to have the connexion made, then he was in the right. If plaintiff was not entitled, and the Council were in a position to say the plaintiff could not connect the pipes, then the plaintiff was in the wrong.

Mr. Younger: Yes, it would be a technical trespass by the plaintiff.

Mr. Hughes (interposing): I contend that, even assuming the plaintiff was entitled to have the connexion made, he was not justified in doing it himself.

His Lordship did not agree. Here, he said, the plaintiff had tendered the Council the money and asked them to make the connexion, and it did not appear to him (the Judge) that he had to make any distinction whatever as to whether the Council or the plaintiff did it.

Mr. Younger, resuming his argument, said he quite agreed with his Lordship that if the plaintiff had completed the work within the six weeks under the notice served upon him he would have had the right to demand the work to be done by the Council or have done it himself.

Finally his Lordship said he would consider his judgment.

LONDON COUNCILS.

Barking.—A portion of Ripple-road and the present macadam margins of the carriageway in a portion of East-street are to be repaved. The tender of Mr. W. E. Davey, Southend, has been accepted at 1,820*l.* for the erection of an administrative block at the Upney Hospital.

Barnet.—Plans have been passed for Messrs. Lavington Brothers for four houses in Normandy-avenue.

Battersea.—Repairs are to be carried out to the roadways of Ford's-place and Little Europa-place at a cost of 100*l.* The carriageways of six roads are to be repaired with flints at an estimated cost of 750*l.* At a cost of 352*l.* the carriageway of Lavender-gardens is to be made-up with tarred slag macadam.

Berkhamsted.—The Rural District Council has passed plans for Mr. J. G. Williams for the erection of four houses at Tring Station.

Bermondsey.—Plans have been passed for Messrs. F. Smith & Co., Carpenters-road, Stratford, E., on behalf of Messrs. Gilman & Spencer, for the erection of an institute at the rear of Princes-street; also for Mr. G. E. Pengelly, Acting Resident Engineer, Port of London Authority, Surrey Commercial Docks, Rotherhithe, for the erection of a motor ambulance garage at Surrey Commercial Docks.

East Barnet.—Sanction has been received from the Local Government Board to the borrowing of 3,330*l.* for street improvement works in Alverstone-avenue, Cromer-road, Oakhurst-avenue, and Rosslyn-avenue.

East Ham.—A plan has been passed for Mr. F. Hamlett for four houses in Cotswold-gardens. Mr. F. H. Buen has lodged plans for the erection of club buildings in High-street South.

Hackney.—Land in Northwold road has been acquired for the purposes of a branch library, and the Architect has been instructed to prepare plans, etc., of the proposed building. The tender of Mr. George Porter, 54, Millfields-road, Clapton, N.E., has been accepted at 592*l.* 1s. for the supply and delivery of the necessary materials, and for paving the carriageway of part of Cassland-road with old granite setts laid on a bed of Portland cement concrete. The following plans have been passed:—Mr. H. Brooking, on behalf of Mr. A. E. King, buildings, Springfield, Upper Clapton; Mr. F. Collins, ten houses, Springfield-gardens, Upper Clapton; Mr. F. J. Coxhead, maternity hospital on site of Nos. 153-63, Lower Clapton-road; Mr. D. S. Barclay, eight houses, Craven-walk.

Hammersmith.—A portion of Sinclair-road and Maclise-road is to be paved with asphaltic

compound at an estimated cost of 63*l*. Messrs. Prickett & Ellis have lodged plans with the London County Council for a mission hall on the site of Nos. 56 64, Becklow-road. At the last meeting of the Borough Council a motion of Councillor H. T. Johnson was carried to the effect that, in the opinion of the Council, it had become necessary, without further delay, to repave with wood blocks the margins of the carriageways forming the principal tramway routes in the Borough, for the maintenance of which the Council is responsible. It was referred to the Works Committee to consider what steps should be taken to have the work carried out.

Hendon.—A quotation of the Roadament Company, Ltd., has been accepted for laying a trial length of asphalted grouted macadam in Golder's Green-road, at 6s. per super. yard, subject to an agreemens being entered into as to maintenance. Plans submitted by the Surveyor have been approved for making up a portion of Colindale-avenue and the bridge over the Silk Stream, and application is to be made to the Local Government Board for sanction to a loan of 1,534*l*., for carrying out such works. Estimates have been approved for carrying out permanent works at the Retreat and Chequers-alley at an estimated cost of 150*l*. The footpaths in a portion of Parson-street are to be kerbed and paved at an estimated cost of 459*l*. Plans have been approved for making up Rotherwick-road, Golder's Green (the carriageway with tarred macadam), at an estimated cost of 1,956*l*. Widening and improvement works are to be carried out at the junction of Church-road and Brent-street, at an estimated cost of 126*l*.

Heston and Isleworth. Electricity mains are to be extended at an estimated cost of 200*l*. The following plans have been passed: Messrs. P. Chase, Gardener, & Co., houses, Hanworth-road, Hounslow; house, Thornbury-road, Spring-grove, and alterations and additions to No. 96, Bath-road, Hounslow; Messrs. Tapperell & Haase, electric theatre and six shops, Neal's-corner, Hounslow; Messrs. Ash by's Staines Brewery, Ltd., alterations to "Builders' Arms," Derby-road, Hounslow; Mr. A. O. Little, alterations, "Rising Sun" public-house, Cranford-lane, Heston; Messrs. H. Somerford & Son, library, Gumley House, Isleworth; Mr. Frank J. Fisher, alterations to the Ailsa Tavern and Railway Inn, Isleworth. Plans have been by Messrs. P. Chase, Gardener, & Co., for a cinematograph theatre in Staines-road, Hounslow.

Hornsey.—Electricity mains are to be extended at an estimated cost of 4,000*l*. Plans have been passed for Mr. G. W. Booth, Chandos-street, W.C., for carrying out alterations and additions to the "Shepherd's Cot," Shepherd's-hill, Crouch End.

Ilford.—The following plans have been passed:—Mr. A. E. Larner, for Mr. J. Fountain, four houses, Birkbeck-road; Mr. A. T. Haines, four houses, Bradford-road; Mr. A. Grimes, six houses, Francis-avenue; Mr. H. Samsburgh, five houses, Cowley-road; Mr R. R. Shuttleworth, ten houses, Lilac-terrace; Mr. E. T. Dunn, offices, Ilford-hill, five houses, Abbotsford-road, and eight houses, Ashgrove-road.

Islington.—An offer of Messrs. T. Gabriel & Sons, Commercial-road, S.E., at 97*l*. 2s. 6d., has been accepted for the supply of 149,000 creosoted yellow deal blocks for repaving portions of Hornsey-road.

Leyton.—Sewers are to be relaid in various roads of the Borough, and application is to be made to the Local Government Board for sanction to borrow 1,600*l*., the estimated cost of the work. The following plans have been passed:—Mr. J. F. Schofield, gospel hall, etc., corner of Park and Goldsmith roads; Mr. F. J. Coxhead, public hall, Canterbury-road; Messrs. A. & E. Ruggles, three houses, Matlock-road.

Middlesex County Council.—Instructions have been given for the preparation of plans, and tenders are to be invited, for the erection of a school in Bourne-hill, Southgate, for the accommodation of about 800 children.

Poplar.—A plan has been passed for Mr. Albert Phillips for the erection of a cinematograph theatre on the site of Nos. 102-4, East India Dock-road.

St. Pancras.—Electricity mains are to be extended at an estimated cost of 80*l*. A provision is to be made in the next estimates for the repaving of a portion of Gower-street with creosoted deal blocks at an estimated cost of 501*l*.

Southgate.—Wood is to be substituted for granite for the proposed crossings in Green-lanes main road, at an estimated cost of 150*l*. Cannon-road is to be made-up as a new street. The following plans have been passed:—Mr. W. A. Goring, five houses, The Mall; Messrs. W. C. Leak & Son, four houses, Conway-road; London General Omnibus Company, motor garage, Regent's-avenue, Palmer's Green; Messrs. W. S. Simpson & Co., additions at the British Aniline Dye and Chemical Works, Reservoir-road.

Southwark.—Plans have been lodged with the London County Council by Messrs. Field & Sons, 54, Borough High street, S.E., for the erection of a building at the rear of No. 1, Princess-mews, St. George's-road, S.E.

Tottenham.—Barry-avenue and South-grove are to be made-up as new streets.

Watford.—The bridle-path from High street to Albert-road is to be paved with flag paving. The Surveyor has been instructed to prepare plans and estimates for private street works in Field-road, Oxhey-avenue, and Ashby-road. An electricity main is to be laid at an estimated cost of 350*l*. Steps are to be taken for the preparation of plans, estimates, etc., with a view to application being made to the Local Government Board for sanction to a loan of 2,750*l*. for the erection of a Carnegie Library. The following plans have been passed: Messrs. Salter & Co., Rickmansworth, alterations to White Hart public-house, High-street; Mr. J. Bonham, six houses, Bushey Mill-lane; Mrs. Wright, rebuilding warehouse, rear Nos. 157-9, Queen's-road; Mr. T. Callam, four houses, Oxhey-lane; Messrs. Bracey & Clark, three houses, Ashby-road; alterations, Primitive Methodist Church, Queen's road, for the Trustees. A plan has been lodged for a factory on the Cassiobridge Estate for the Baryta Company, Ltd.

CORRESPONDENCE.

The London Building Trades.

SIR,—My attention has been drawn to an inaccurate statement in reference to a matter headed "The London Building Trade Strike Averted," which has appeared in various newspapers, and, in order to remove any erroneous impression, I should be much obliged if you would insert the following official statement in your next issue, viz.:—

No strike notices have been received, nor has any dispute in the trade at present arisen. The London Master Builders' Association, however, has met the representatives of the carpenters and joiners in conference, and agreed to increase the present rate of wages by ½d. per hour in the first week in September, and by a further ½d. per hour in the first week in March, 1913, on the understanding that all other demands made by the carpenters and joiners are withdrawn, and that certain alterations are made in the present working rules.

No negotiations have been entered into with other branches of the trade, but those notices which have been received will be dealt with in due course.

JAMES S. HOLLIDAY,
President, London Master Builders' Association.

Timber Specifications.

SIR,—The specification given in your last issue is a good one, but obviously only intended for work of a very much higher class than the average.

"Finish," of course, should be "Finnish" in first paragraph. Personally, I should leave out the last clause of the last paragraph; and in the first clause of last paragraph should insert 5 per cent. in place of "small proportion."

JOHN E. YERBURY.

SIR,—With the repeal of the timber duties there is no official selection of timber into grades and qualities, and the few stock sizes are now expanded, and scantlings can be obtained from 2 in. by 2 in. to 12 in. by 6 in.

Instead of the ports being few in number, they are now many, and the importer's brands shown by their initials on the ends of the deals are so numerous that it would be impossible to specify with certainty any one of them.

It is therefore necessary to give a general description and specify the country or sea the timber comes from.

Timbers used in buildings have three principal sources of supply.

First, Baltic or Norway ports. This timber—and this includes the sawn scantlings called deals or battens—owing to the cold and stormy climate, is slow grown and of a close texture, and is the best and only timber suitable for outdoor use or as ground joists, or any situation where it is exposed to wet or damp.

As all timber is classed as deal by the trade, it is not necessary to use the botanical names; it is only necessary to specify red or white deal of first quality from Baltic or Norway ports.

In London red deal is called yellow deal. For timber in the log it is usual to specify Memel or Dantzic. Memel is by far the most durable, but is not grown so large as Dantzic.

Second, and by far the largest source of supply comes from the Gulf of Bothnia. Here the nature of the climate, sheltered from the storms and cold, enables a more rapid growth and a softer wood, and as it throws out a large number of branches causes it to be full of knots large and small.

The deals are suitable for any outdoor use, but they and the logs are unfit for use externally or where subject to damp.

It will be sufficient when using this timber to specify what is known as Second Gefle quality, as the brands are very numerous.

Third, White Sea timber. This is a very high-class timber both in red and white, and is the deal most used for good joinery. The knots are small and not numerous, and though sometimes they are dead, this is only the case with overgrown trees.

The white deal stands well, does not warp, and is harder than Baltic deals; and for dressertops and all shelving that requires washing is a favourite wood.

It is usual to specify this as red or white deal of first Onega quality pitch-pine. This is a great favourite, for large scantlings went out of fashion a few years since owing to its failure as ground joists or in damp positions. It is costly to work as joinery. If required for its curl or figure it should be specified, but from unsquared logs, as in the process of squaring the logs for shipment the figured wood is cut away.

Flooring. The 1¼-in. red deal flooring of our forefathers cannot be bettered, and can still be obtained from Baltic ports. Pitch-pine also makes good flooring. Gulf of Bothnia flooring is too soft and knotty.

White Sea white deal flooring is good. Spruce has not been favoured, but I have used large quantities in imported 5-in. widths, and it makes good floors and has been a favourite with my clients, as it looks so clean and it is cheap.

Oak. Architects specify oak, forgetting there are some fifty varieties of this wood on the market. In wainscot oak there are four qualities. It is too long a subject for this letter. I will only say—if you cannot get English use Stetten oak, and never allow American white oak even for sash-frame sills.

Gloucester. ROBERT PHILLIPS.

SIR,—I quite agree with your correspondent, "A Reader," that the usual architect's specification wants modernising. My observations extending for many years on a timber wharf have convinced me that "Baltic" timber is more suitable than "White Sea" for carcassing purposes, being stronger and not so inclined to shake. I should say that unsorted yellow boards of a good Swedish or Finnish shipment would be quite suitable for any roof work.

I am afraid your correspondent would find a difficulty in getting all his flooring of first quality, as the proportions usually shipped by the best shippers are 5 per cent. firsts, 55 per cent. seconds, and 40 per cent. thirds, and many importers do not separate the firsts and seconds when piling away.

With reference to joinery, here again the proportion of first quality deals and battens is small, and consequently there must be a larger quantity of second and third quality used. I submit that for all but the very best work second quality stuff is quite good enough, and many reputable builders even use third.

I take it that the class of building largely determines the class of stuff to be used, and if all architects should insist upon your correspondent's specification it would materially add to the cost of the ordinary building, and there would be a large quantity of second and third quality stuff left on the market.

Three-ply wood is now, I believe, used with advantage in panels, and the price is less than either first quality pine or American whitewood.

If the builder places himself in the hands of a reputable firm of timber merchants, and explains the class of work he is doing, I do not think he will go far wrong.

H. F. PEACOCK.

Victoria Wharf,
Wandsworth Bridge.

EDITORIAL SUMMARY.

The leading article deals with architecture, sculpture, and painting at the Paris Salons.

Our second article is upon the life and work of the late Daniel Hudson Burnham (p. 686).

In Notes columns (p. 686) will be found comments on: "The South African War Memorial"; "Wandsworth Council Baths Committee"; "Street Name-Plates"; "Rising Early in the Morning"; "The Piccadilly Blunder"; "Action by the London Society"; "The Institute Elections."

Some notes on "Picture Exhibitions" are given on p. 688.

The R.I.B.A. Election results appear on p. 688.

An article on the Exhibition of Mural Decorations at Crosby Hall will be found on p. 689

Book notices (p. 690) include: "Butterworth's Workmen's Compensation Cases"; "Keystones of Building"; "The Works of Man."

In "Architectural Societies" (p. 691) brief reports will be found of: "York and Yorkshire Architectural Society"; "Edinburgh Architectural Association"; "Architectural Association of Ireland."

An article on "Building Act Anomalies" appears on p. 692.

In Law Reports (p. 694) a report appears of the case of "Denman *v.* Finchley Urban District Council"—frontager's action against the Council.

In Correspondence columns (p. 695) will be found letters on: "Timber Specifications."

The Illustrated Monthly Review of Construction (p. 697) includes: "New Premises for Messrs. Whiteley's"; "Bungalow, Howth, Dublin"; "The Bovis Window"; Notes, etc.

The Building Trade Section (p. 705) includes: "The Insurance Act"; "Strikes"; "Registration of Title"; "Concrete-Mixers"; "Builders Accident Insurance."

MEETINGS.

SATURDAY, JUNE 15.

The Carpenters' Company, London-wall.—Dinner to the Incorporated British Institute of Certified Carpenters in the Hall of the Company. 5.30 p.m.

TUESDAY, JUNE 18.

Crosby Hall, Cheyne-walk, Chelsea.—Professor Selwyn Image and others will speak on "The Future of Mural Decoration." 8.15 p.m.

THURSDAY, JUNE 20.

The Institution of Municipal Engineers.—Western district meeting at Cinderford

The Society of Antiquaries.—8.30 p.m.

ILLUSTRATIONS.

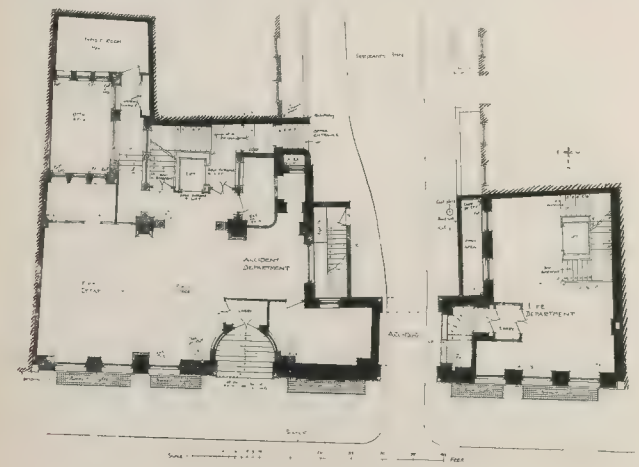
Nos. 48-52, Fleet-street, E.C.

THE building is designed to accommodate the Norwich Union Fire, Life, and Accident Insurance Societies, and takes the place of similar premises (No. 50, Fleet-street), erected about 1840, after the designs of Mr. Beazley.

Rebuilding has been necessitated by the widening of Fleet-street, where, at this point, some 10 ft. to 12 ft. of depth is taken from the old buildings. In order to provide additional area, the sites on either side of the building have been acquired, and the new building will have a frontage to Fleet-street of about 100 ft.

As will be seen by reference to the plan, the twin archway entrances give access—the one on the east to the Fire and Accident Departments, and the one on the west to the Life Department and to Serjeant's Inn. There is also an entrance from Serjeant's Inn, giving access by the main staircase and lift to the upper floors. The whole of the external elevations, including those in Serjeant's Inn, will be carried out in Portland stone.

The building consists of lower ground, ground, and three floors, with fourth floor over part. The whole of the ground floor and parts of the lower ground floor are required for the general offices; the first floor is devoted to managers' rooms, and board-room, and the greater part of the two upper floors is devoted to surveyors, accountants, inspectors, and others.



The building will be heated by radiators and ventilated as far as possible without mechanical assistance.

The shape of the site is such that it has been possible to arrange for all the rooms to have windows opening direct to the outer air, the open area at the back being enclosed on three sides only. Thus there is no lighting or ventilation into wells.

The fact that the entrance to Serjeant's Inn was not central on the site raised some difficulty, and an attempt was made to substitute for the present archway an entrance, nearly double the width, in the centre of the elevation, with foot pavements on either side of the roadway under the arch and entrances from the pavements into the offices; but opposition from the occupiers in Serjeant's Inn rendered this scheme so difficult that, although it had been completed, quantities published, and tenders obtained, it was decided to remodel the design, keeping the entrance to Serjeant's Inn in its present position.

Some may think that a valuable improvement has been lost, but as the right of way is a private one it would be difficult to alter it without full consent.

Messrs. Howell & Brooks, 4, Queen Victoria-street, E.C., are the architects.

Nos. 48-52, Fleet-street.
Messrs. Howell & Brooks, Architects.

Business Premises, Queen's-road.

Two of our plates this week are devoted to the building in Bayswater, erected for Messrs. Whiteley, Ltd., by Messrs. Belcher & Joass. The "Elevation to Queen's-road" drawing is shown in the present Royal Academy Exhibition. We refer at length to the building in the article beginning on the next page.

COMPETITION NEWS.

A list of current Competitions is printed on page 709.

Council Offices, Portland.

Mr. A. Needham Wilson was the assessor in this competition. The first premium (50*l.*) was awarded to Messrs. Spier & Beavan, Borough Chambers, Wharton-street, Cardiff, and the second premium (10*l.*) to Mr. Ernest E. Fetch, 20, John-street, Adelphi. The designs were exhibited at the Wesleyan Schools, Portland, on May 30 and 31.

Bandstand, St. Leonards-on Sea.

The competition for a sunk arena and bandstand in the lower Warrior-square Gardens, St. Leonards-on-Sea, has been decided. Mr. H. W. Wills, A.R.I.B.A. was the assessor. The first premium (fifteen guineas) has been awarded to Mr. Philip H. Tree, F.R.I.B.A., 59, London-road, St. Leonards-on-Sea; and the second premium (ten guineas) to Mr. C. G. Boutcher, 40, Great James-street, Bedford-row, London.

Baths at Wombwell.

The first premium (40*l.*) in this competition has been awarded to Mr. Harold Burgess, Queen Anne's-chambers, Westminster, who has been appointed to carry out the work. The second premium (30*l.*) has been won by Messrs. C. Harrison Townsend, F.R.I.B.A., and Arthur F. Bryan, A.R.I.B.A., 32, Queen's-road, St. John's Wood, and the third premium (20*l.*) goes to Messrs. Jas. G. Bowden and C. F. Moxon, of Westminster and Barnsley. The designs are to be exhibited at the Wombwell Library, from June 17 to 22.

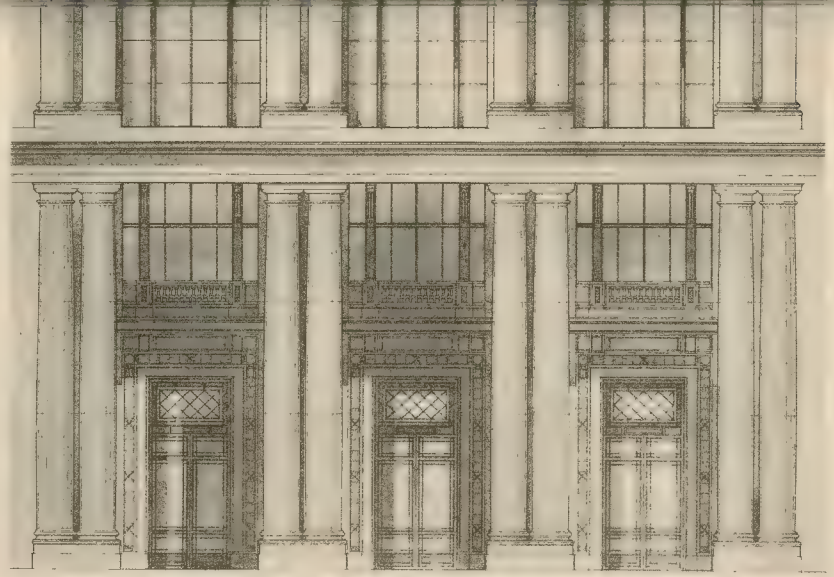
Street Name-Plates.

In connexion with the recent Conference on this subject, it is possible that a competition may be held for the provision of a good design for general use.

FIFTY YEARS AGO.

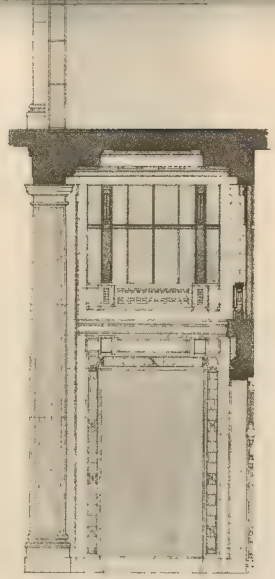
From the *Builder* of June 14, 1862.

Atlantic Telegraph.



THE amount of assistance which the Government will lend to the company formed to lay a submarine telegraph-cable across the Atlantic has now assumed a definite form. The Government agrees to make a new and more complete survey of the bed of the Atlantic, and will also grant the use of vessels to lay the cable. It appears that the original agreement to pay 14,000*l.* a year to the Telegraph Company so long as the cable is working still exists; and the Government will not, in a pecuniary way, go further than the arrangement.

FLATS FOR WORKING MEN



The London Housing Society, Ltd., 49, Euston-road, formed under the Industrial and Provident Societies Act, 1893, for the purpose of providing improved housing accommodation for the industrial classes, are arranging for the further issue of shares. The directors are the Ven. W. M. Sinclair, D.D., late Archdeacon of London, Mr. P. S. Robins, of Messrs. Robins & Hine, surveyors, and Mr. F. Knollys. A new site of over half an acre, with a frontage of 110 ft. to Judd-street, has been acquired recently, and the new buildings will provide accommodation for about 186 families.

MONTHLY REVIEW · *of* · CONSTRUCTION.

Fig. 1. Octagonal Hall.

MESSRS. WHITELEY'S NEW PREMISES.—I.

NEARLY fifty years ago the late William Whiteley laid the foundation of the important business still bearing s name by opening a small drapery hop in Westbourne-grove. Successive exten- ons led to the development of the under- king until a long series of shops became ecessary for the conduct of business in that horoughfare.

After a time the demand for additional commodation was met by the erection of a w building in Queen's-road, and in October, 910, the foundation-stone of the building ecently completed in the same road was laid the Mayor of Paddington.

The three blocks of buildings mentioned are hown by the site plan reproduced in Fig. 2, hich is given with the object of enabling the ader to start with a clear idea as to the relative ositions of the three portions.

Part of the old premises in Westbourne-grove e at present occupied, but we understand at the various shops will ultimately be let approved tenants.

The old part of the Queen's-road building as been remodelled inside and connected ith the new premises in Queen's-road. At later date the old part will be provided with w façades on Queen's-road and Douglas-place, estbourne-grove, and the main frontage will en present the appearance shown by the evation on one of the accompanying plates.

Workrooms are provided in the wing pro- ting from the back of the new premises and sidential accommodation for a portion of the aff in a row of private houses in Porchester- rdens.

The new building measures about 360 ft. ng, the total length of 540 ft. being contem- ated by the complete project, this being, of urse, the collective length of the old and w buildings on Queen's-road. The new emises extend back for a depth of 175 ft., proximately, and the main parapet is at the erage height of 70 ft. above pavement level. The building includes four floors and a terrace of open to the public, and a basement devoted accommodation for power plant, machinery, d various administrative departments.

As plans and sections showing the arrange- ment and general design of the interior are not available for publication, it is somewhat difficult to make these features perfectly clear. It is hoped, however, that the following description, read in conjunction with the elevation to Queen's-road and the steelwork plans in Figs. 5 and 6, will be sufficiently intelligible.

The main entrance forming the central feature of the complete project gives access to a spacious vestibule, beyond which is a rotunda of about 53 ft. diameter inside the galleries and extending to the top of the building, where it is covered by a glazed dome of 67 ft. diameter, rising to the height of 150 ft. above street level.

Midway between the rotunda and Porchester- gardens is an octagonal hall, similar in general arrangement to the rotunda and covered by an octagonal glazed dome above main roof level, the hall measuring about 50 ft. by 42 ft. inside the galleries.

At the junction of Queen's-road and Por- chester-gardens there is a secondary entrance beneath the corner turret, this entrance opening into a circular hall, whence the public gain access to the show-rooms beyond. An entrance from Queen's-road opens directly into the octagonal hall, and another is provided about the middle of the Porchester-gardens façade. The staff entrance is at the western end of the same façade.

All four floors of the building are devoted to the numerous branches of commerce under- taken by the firm, and the comfort and con- venience of customers and visitors has been most carefully considered.

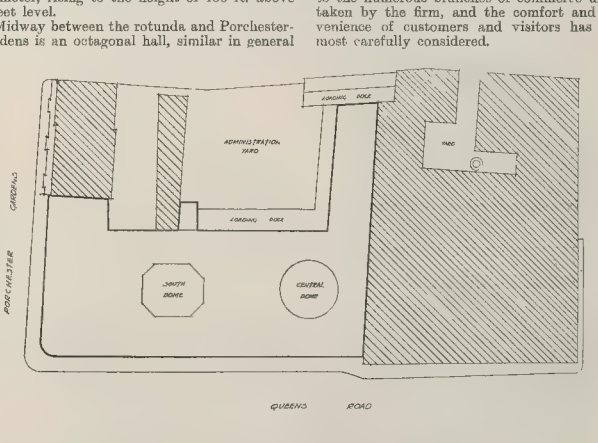

Fig. 2. Messrs. Whiteley's New Premises: Site Plan.

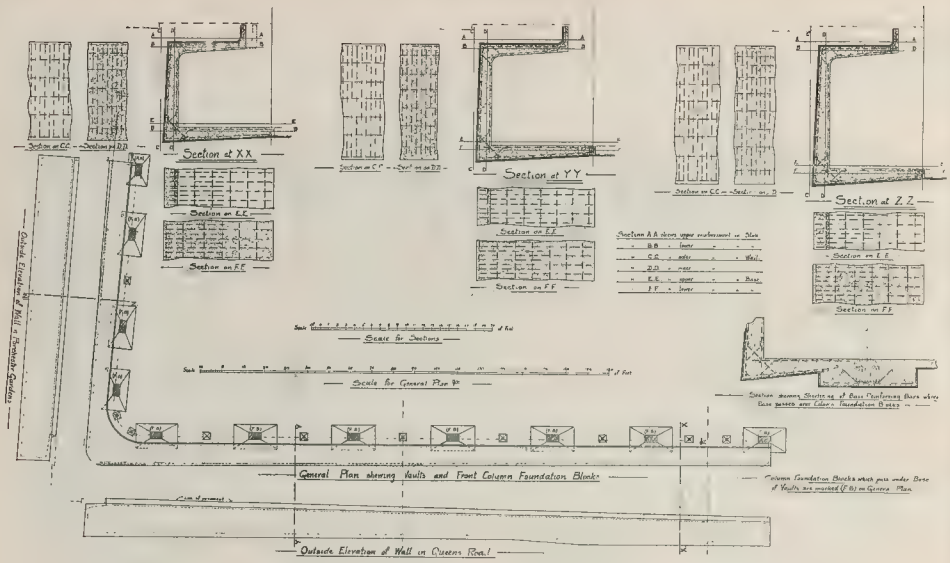

Fig. 3. Part Plan of Footings and Details of Retaining Walls.

Recognising the fact that shopping as regarded by the fair sex is an important function that must not be hurried through or performed without careful deliberation, the management have provided well-appointed refreshment-rooms, with reading and rest rooms for ladies, a recreation-room for children, and a smoking-room and lounge where gentlemen may while away the hours occupied by their wives or lady relatives in the technical details of purchases outside the province of the mere man.

Another attractive feature of the premises is an Italian garden on the terrace roof, which will form a pleasant retreat in summer-time.

As many of our readers are doubtless aware, the new premises were designed by Mr. John Belcher, R.A., and Mr. J. J. Joass, A.R.I.B.A., who have very skilfully reconciled the somewhat conflicting requirements involved by the desire of the firm for a building embodying good architecture with adequate facilities for the display of goods in the shop-windows and elsewhere.

Regarded as a whole, the main front is a harmonious and effective composition marred only by the appearance of inadequate support in the lower story for the line of massive columns above. The architects have evidently made a vigorous attempt to break away from the practice of designing shop buildings so that a monumental structure of masonry has the aspect of resting upon the unsubstantial support afforded by a series of plate-glass windows. In the present case, while the inexorable demands for window space in excess of that dictated by architectural considerations have not been entirely overcome, the bold treatment of the main and corner entrances and the introduction of massive stone columns marking the departmental sections of the establishment are features deserving appreciative notice.

From the standpoint of construction, and therefore from that of architecture, the weakest characteristic of the façade is the manner in which the intermediate upper columns in each bay have the aspect of being carried by a stone beam of 40 ft. clear span, and made up of numerous blocks jointed together. It is perfectly clear that a member of the kind could not possibly perform the duty which it appears to discharge, and so in this respect the architecture of the façade is not in agreement with its ostensible construction.

The main entrance, of which we give enlarged details on our plates, has three doorways approached through four pairs of Cornish grey granite fluted columns 30 ft. high by 3 ft. in diameter. These, together with the moulded caps and bases, the heavy granite piers to the doorways, the polished doorways, and similar granite work in the lower part of the façades were quarried and dressed by Messrs. John Freeman, Sons, & Co., Ltd., of Penryn, the whole of the granite, equal to some 6,500 cubic ft., having been prepared within three months.

The columns are continued upward in Portland stone, which was employed through out the upper part of the façades, and the entrance bay is surmounted by a pyramidal tower.

The Porchester-gardens entrance with granite columns and details is another noteworthy detail, the treatment of the corner harmonising admirably with the design of the dome-covered turret above the main roof.

The granite carving was executed by Messrs. W. Cullis & Co., and the sculptural work in Portland stone by Mr. H. H. Martin, Mr. A. Broadbent, and Mr. J. Crosland McLure.

The Nine Elms Stone Masonry Works, Ltd., and Messrs. Holloway Bros. (London), Ltd., were responsible for the supply and execution of the Portland stonework, the coping to the walls was executed by the Patent Impervious Stone Company, and the geometrical pattern paving at all the entrances was prepared by Messrs. J. Whitehead & Sons, in Penteli and Derbyshire Fossil marbles.

The most striking architectural features of the interior are the rotunda in line with the main entrance, and the analogous octagonal hall between the rotunda and Porchester-gardens. Although openings of the kind extending throughout a building are undesirable from the point of view of fire-resisting construction, it is equally certain that in the present case they lend dignity to the establishment and have the effect of distributing abundant light from the glazed domes above. Moreover, the galleries around the openings are most convenient for visitors, and two

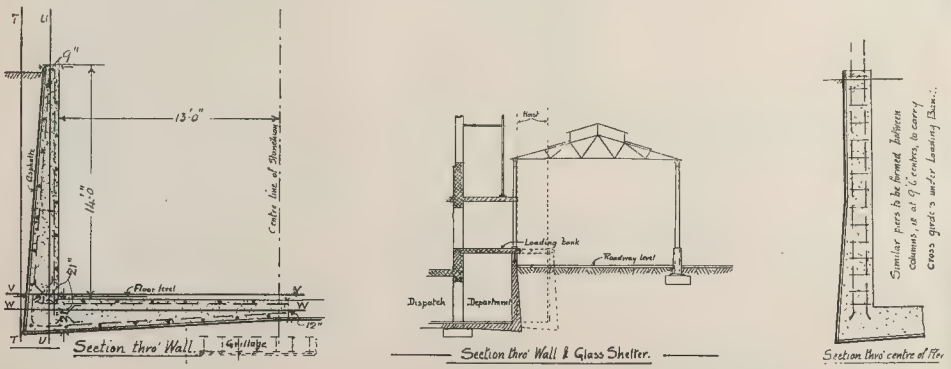

Fig. 4. Section through Back Wall and Yard, and Details of Retaining Wall Construction.

them afford excellent accommodation for the tea-rooms, as shown in Fig. 1, the restaurant being on the upper gallery of the rotunda.

In the rotunda a double staircase of elliptical form, with balcony at the top of the first flight, leads from the ground floor to the first floor. This stairway is in cast-iron and was supplied by Messrs. Walter MacFarlane & Co., the treads being in Penteli marble prepared and laid by Messrs. J. Whitehead & Sons. Two rectangular main stairways were supplied by The Crittall Manufacturing Company, Ltd.

An effective feature of the rotunda and the other hall is constituted by the two series of "Siena" scagliola marble column casings for the steel stanchions extending from the ground floor up to the domes. There are seventy-two of these casings, all fitted by Messrs. Bellman, Ivey, & Carter, Ltd., who also executed the enriched capitals and moulded bases, bronzed with pure copper by special process.

Structurally considered, the new building is of the steel-frame type, the entire weight of the stonework, brickwork, floors, and other details being taken by steel joists, girders, wall lintels, and columns.

The apparently massive stone columns and masonry on the exterior are in reality nothing but architectural masks concealing the actual construction, and the interior walls dividing the building into seven distinct sections, for the limitation of fire risks and for convenience of management, are similarly supported by the steel skeleton.

The finished structure, however, conveys little if any idea of its essential nature. In addition to the materials already mentioned the steel frame is enclosed by large quantities of building materials, including Fletton bricks supplied by the London Brick Company, "Impervit" ivory-glazed bricks and "Shepwood" partition bricks by the Leeds Fireclay Company, Ltd., wall tiles and terrazzo flooring by Mr. Lewis Bennett, roof tiles by the Lavington Brick and Tile Works, and artificial stone in the form of paving and stairs by the Patent Impervious Stone Company. Asphalt for the damp-courses was supplied by Messrs. Lawford & Co., and the plasterwork, covering a surface of about a million square feet, was executed by Messrs. B. H. Johnson & Sons and Messrs. G. & A. Brown, Ltd.

The interior fittings, furniture, and various fixtures were supplied by well-known specialist firms, among whom may be mentioned—Messrs. J. W. Singer & Sons, Ltd., and Messrs. Henry Hope & Sons, Ltd. (bronze doors), the Bostwick Gate Company, Ltd. (folding gates), Messrs. W. T. Allen & Co. (railings), Mr. John P. White (treillage in the restaurant and roof garden), Messrs. F. Sage & Co., Ltd. (bronze shop fronts and fittings in four departments), The Crittall Manufacturing Company, Ltd. (doors and window-sashes), Messrs. Harris & Sheldon (fittings in four departments, including some fine examples of cabinet-work in French walnut), Messrs. Courtenay, Pope, & Co. (fittings in two departments), Messrs. S. Haskins & Bros., Ltd. (various fittings), Messrs. Marsh, Jones, & Cribb (Austrian oak fittings in the book department), the Bath Cabinet Makers Company, Ltd. (various fittings), Milner's Safe Company, Ltd. (locks), Messrs. Carter & Aynsley, Ltd., Messrs. E. Showell & Sons, Ltd., and Mr. James Gibbons (door furniture). No fewer than 2,110 showcases have been placed in the new premises for the display of goods.

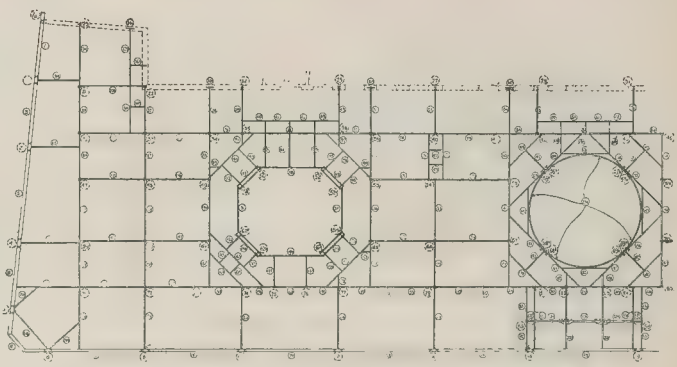

Fig. 6. Steelwork at Upper Floor Levels (Typical).

Foundations and Retaining Walls.

We are informed that the work of excavation on the site involved the removal of more than 90,000 cubic yds. of material, and that some 9,000 cubic yds. of concrete have been used as foundations and otherwise in the basement story.

The bulk of the foundations consist of extensive grillages formed of rolled-steel sections embedded in concrete and intended for the support of the exterior and interior columns by which the load of the building and its contents is transmitted to the ground.

In Fig. 3 may be seen the arrangement of the column footings along part of Queen's-road and Porchester-gardens, but the dimensions there shown were subsequently altered in consequence of the decision to adopt steel grillages in place of reinforced concrete footings, as originally intended.

The same drawing (Fig. 3) contains typical sections of the reinforced concrete retaining walls along the frontages. These comprise three elements—(*a*) an extended base supporting the wall proper and forming part of the basement floor; (*b*) the retaining wall proper; and (*c*) a cantilever projection carrying the street pavement and extending from the kerb to a pavement light outside the building line.

This ingenious application of reinforced concrete was designed by Mr. Alexander Drew, the consulting structural engineer acting with the architects, and was carried out under his direction by Messrs. Holloway Bros., the general building contractors.

Thanks to the small thickness of the retaining wall and of the upper cantilever projection, an important area has been added to the basement floor. The sections show clearly the disposition of the reinforcement and render detailed description unnecessary.

Fig. 4 is a section through the back wall of the new premises, showing the retaining wall construction, providing space beneath the loading platform and accommodation for exterior hoists connecting the dispatch department with the upper stories of the building. The same drawing includes an enlarged section giving details of the reinforced concrete work.

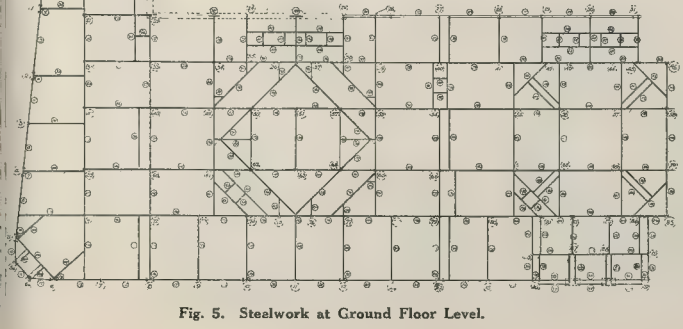

Fig. 5. Steelwork at Ground Floor Level.

Steel Construction.

The whole of the steelwork was designed by Mr. Drew, the consulting engineer, and the contract for supplying and erecting the skeleton of the building was undertaken by Messrs. Dorman, Long, & Co., Ltd., of Middlesbrough.

The steelwork as well as the glazing of the domes was executed by the British Challenge Glazine Company, Ltd., and the steel-frame structure for the exterior lifts and the roofing over the dispatching yard were constructed by Messrs. Powers & Deane Ransomes, Ltd.

Figs. 5 and 6 will serve the purpose of giving a general idea of the main skeleton of the new premises. The former is a key plan of the steelwork at ground-floor level, and the latter a typical plan applying approximately to the upper floors. In these plans and all other drawings prepared by the consulting engineer the beams are denoted by numbers inscribed in a circle, and the stanchions by numbers inscribed in a broken circle. The reference numbers appeared on the corresponding sheets of details wherein the column loads, beam reactions, and other calculated particulars were given for the purpose of facilitating the work of the contractors.

Fig. 6 will enable the reader to trace the positions of the supports for the interior walls dividing the building into the seven distinct sections already mentioned, and is also of interest as showing the nature of the framework carrying the galleries around the rotunda and the octagonal opening fulfilling a similar purpose.

To describe and illustrate the framework adequately would be a somewhat lengthy operation, and the result would probably be wearisome to our readers. Therefore we simply refer to a few specially interesting details of the construction.

In Fig. 7 are shown two plans of the construction which forms a connecting-link between the old portion of the Queen's-road building and what was at first intended to be the end of the new premises. For practical reasons it was afterwards decided to continue the new work so as to include the bay in question. The left-hand plan shows the old party walls and indicates the underpinning necessitated below the basement floor level, and the right-hand plan is typical of the construction in the upper stories. The girders are securely anchored into the party wall by pieces of rolled-steel I-beam, from 3 ft. to 4 ft. 6 in. long, as indicated, and the façade between stanchion No. 19 and the old party wall is of temporary character, having been constructed so that it may be removed without difficulty when the time comes for the building of the new frontages along the old portion of the premises, in accordance with the complete scheme of the architects.

Fig. 8 contains a selection of details showing the methods adopted for supporting the masonry cornice at second-floor level. The part plan

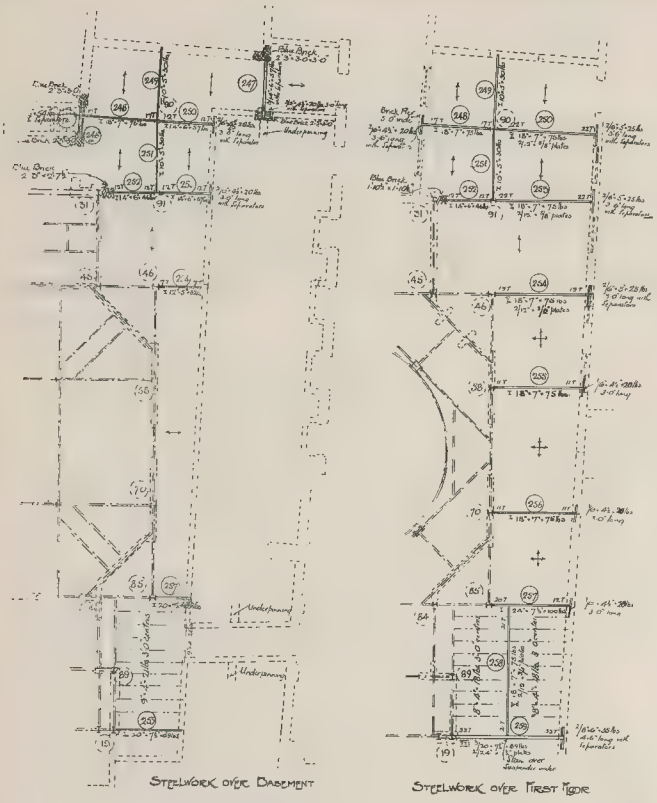

Fig. 7. Plans showing connexion between Old and New Buildings.

at the left-hand bottom corner of the drawing explains the construction above the entrance at the junction of Queen's-road and Porchester-gardens. The corner curve is formed by two channel bars bent to the required shape and connected by diaphragms of I-section at intervals, the curved lintel so constituted being carried at each end by one of the cantilever girders in the façade.

These girders are part of the series extending along both frontages of the premises, the spans ranging from 45 ft. to 55 ft., according to position, and the largest member of the kind weighs over 30 tons. The girders are provided with hangers and brackets for support of the stonework as illustrated in the details reproduced, and the stanchions are fitted with brackets by means of which the column casings are attached in such manner that each piece of stone is directly supported from the steelwork.

Therefore the stone columns, despite their aspect of massive strength, carry no weight, and the individual sections of which they are composed do not even support the weight of sections above them.

Fig. 9 contains a plan and sections giving details of the steelwork at roof level for support of the corner turret and dome, the turret itself being built in masonry. The half plan shows the general arrangement of the steel framing, an interesting feature of this being the manner in which the segment outside the diagonal girder, forming a chord between stanchions Nos. 5 and 6, is carried by suspended cantilevers, as represented in the section on line A–A. This is certainly an unusual, if not entirely novel, application of the cantilever principle in building construction. As elsewhere, the steelwork shown in this drawing is utilised for the suspension of stone by hangers, as well as for its support in the customary way.

Fig. 10 is a section illustrating the methods adopted for supporting the top cornice of the new premises. It will be noticed that the upper courses projecting in cantilever are supported on a block of concrete above the girder and on a block of stone suspended by hangers carried by the same girder, with which are connected anchor straps of copper at intervals of 2 ft. apart for holding down the inner side of the upper courses of the cornice.

The course immediately below the girder represented in section is also suspended from that member by copper straps or hooks at each joint, and, although appearing to act as a support for the cornice, it really has no duty to perform beyond that of harmonising with the general architectural scheme.

The girder is embedded in concrete which is monolithic with that in the "Fram" flooring, the reinforcing bars in this being hooked over the top flange of one of the I-beams in the girder for security of anchorage.

The total amount of metal in the skeleton is approximately 2,500 tons, and the rapidity of construction rendered possible by the steel-frame method of building is denoted by the fact that the structure was formally opened to the public within thirteen months after the laying of the foundation-stone.

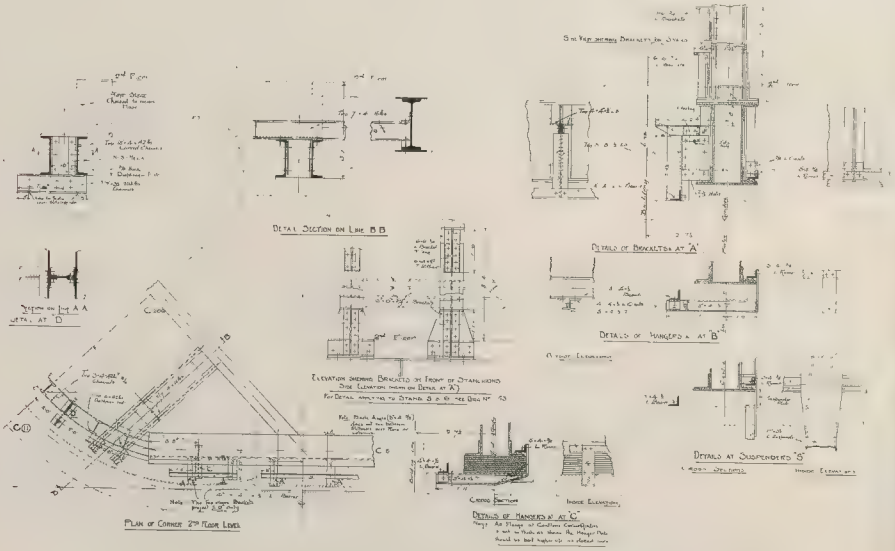

Fig. 8. Details showing methods of supporting Masonry Work.

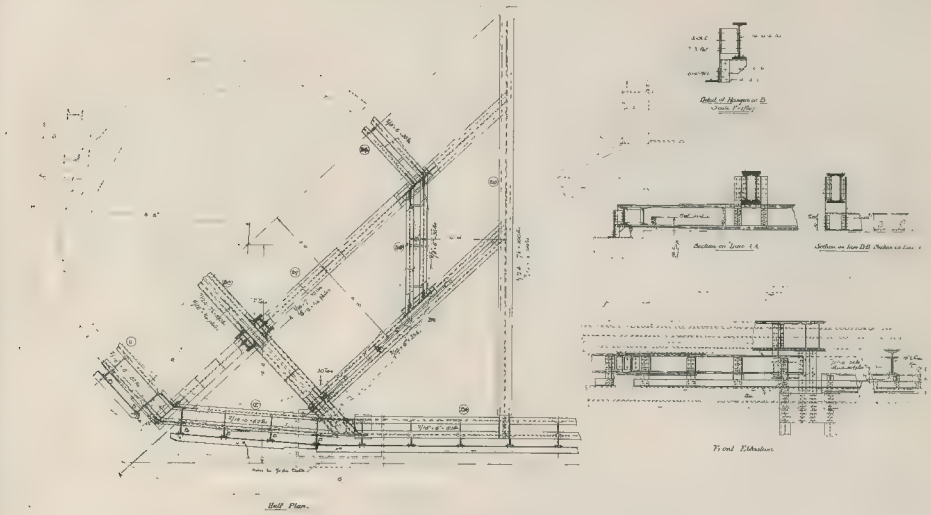

Fig. 9. Plan and Details of Supports for Corner Turret.

Personal.

As mentioned previously, the architects ere Messrs. John Belcher, R.A., and J. J. oass, F.R.I.B.A. Mr. Alexander Drew, I.I.Mech.E., was the consulting engineer esponsible for the design of the steel and einforced concrete work, and for the laying- at of the engineering installations generally, ith the exception of the sanitary arrangements, hich were under the control of Messrs. Corby Boyce, the consulting sanitary engineers.

The quantity surveyors were Messrs. Gleed & elcher and Messrs. Gardiner & Theobald, id the clerk of works was Mr. W. Gunning.

Messrs. Holloway Bros. (London), Ltd., were ie general building contractors. Among the umerous specialist firms acting as sub-con- actors some have been mentioned in the resent article, and others will be referred to succeeding articles dealing with special atures of construction and with the engineering id sanitary equipment of the building.

IY-RIB SYSTEM BUNGALOW AT HOWTH, CO. DUBLIN.

SITUATED at the north-east extremity of ublin Bay, the rocky peninsula of Howth almost entirely surrounded by the sea, and, ving escaped the disfigurements caused rectly and indirectly by railway and tram nes on the southern side of the bay, is well ited for the erection of residential buildings ch as that described in the present article.

The bungalow to which we direct attention is designed by Messrs. Chillingworth & Levie, vil engineers and architects, of Cork, the ntractors being Messrs. Murphy Brothers, the same city.

The foundations are of concrete deposited in nches excavated in the sloping site, and m them rises the superstructure, comprising terior walls and partition walls of cement d lime plaster applied on Hy-Rib steel lathing, th wall columns and main beams of reinforced ncrete, the floors, roof framing, and interior tings being of timber. The Hy-Rib and other nforcement was supplied by the Trussed ncrete Steel Company, Ltd., of Westminster. Figs. 1 and 2 contain elevations and sections, hich serve the double purpose of illustrating e general design and of making clear some tails of the construction.

As shown by Figs. 3 and 4, the bungalow has ree rooms on the ground floor, in addition to mestic offices and servant's bedroom, and three drooms and a bathroom on the first floor.

As we have previously described and illus- ted all varieties of the reinforcement made the Trussed Concrete Steel Company, we d only say of the Hy-Rib lathing that it is duced from sheet steel perforated and nipulated so that each unit of the material comprises a succession of corrugated lathing-panels separated by rigid, high studding ribs of unperforated metal.

The construction of the outer walls of the bungalow will be readily gathered from the following notes.

All the mass concrete in the foundation footings and rising walls to floor or other level consists of concrete mixed in the proportions of 1 part Portland cement, $2\frac{1}{2}$ parts washed sharp sand, and 5 parts of aggregate.

Corner and intermediate wall columns of reinforced concrete include $\frac{5}{8}$-in. and $\frac{1}{2}$-in. Kahn rib bars with circumferential hooping of $\frac{3}{16}$-in. round steel, wired in position at distances of 15 in. apart. The longitudinal bars are embedded in the concrete below wall-plate level to the depth of 15 in. for corner columns, and 12 in. for intermediate columns, as shown by the sectional elevations, Fig. 5.

It should be noted that the circumferential hoops are only used in some of the columns, as represented in Fig. 6 by horizontal lines, the other columns having rib bars alone.

At either side of the columns 6-in. by 2-in. timber uprights are placed, and to these are spiked 6-in. by 2-in. head-pieces.

Where over door and window openings, the head-pieces are supported by the reinforced concrete columns, the space between the frame and head being shuttered by a light board. The timber uprights remain permanently in place, and were employed as shuttering at two sides of the columns.

After the column timbering had been erected, the window and door frames were set in position, and temporary pieces of timber, 5 in. by $1\frac{1}{2}$ in., were fixed at the reveals so as to form with the frame the shuttering at one side of those columns which adjoin doors and windows.

The next operation was to attach the exterior layer of Hy-Rib lathing to the 6-in. by 2-in. uprights by $2\frac{1}{2}$-in. galvanised-iron staples at $10\frac{1}{2}$-in. intervals, and by wiring where the sheets meet at corners and over windows.

When the lathing had been fixed all over the exterior of the building it was rendered on the inside with plaster composed of Portland cement, sand, and lime paste.

Lathing was then similarly attached all over the inside of the enclosing walls to be formed, the lathing then constituting the shuttering for the two remaining sides of the reinforced concrete columns, which were next completed

Bungalow at Howth.

Messrs. Chillingworth & Levie, Architects.

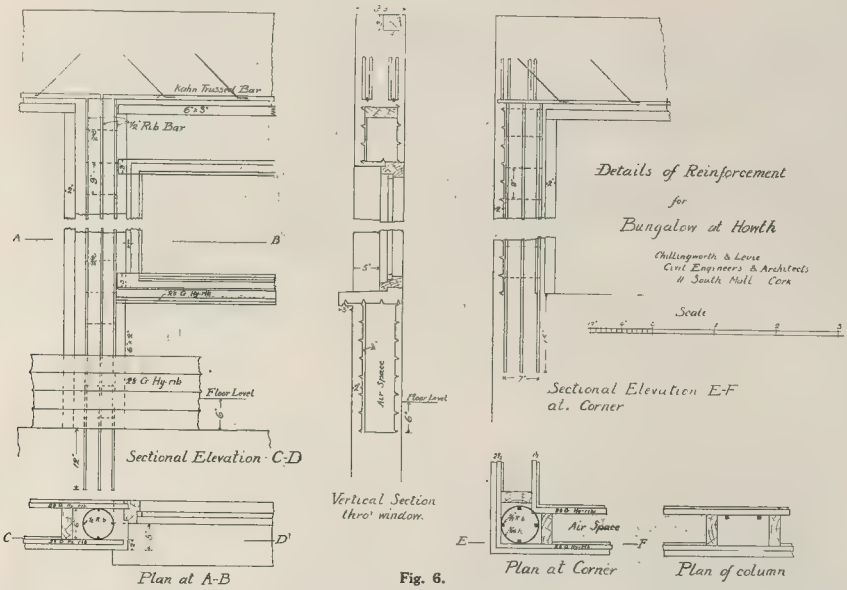

Fig. 6.

y concrete, mixed in the proportions of 1 part Portland cement, 2 parts washed sand, and parts aggregate, and filled in from the top.

The aggregate was carefully selected so as not o exceed ¾-in. diameter, and the columns were nspected by the architects before any of the xterior or interior plastering was executed.

The Hy-Rib lathing only extends to the bottom f the reinforced concrete roof beams shown in ig. 6, these beams being reinforced with Kahn russed bars and moulded in the customary nanner.

The plaster for the inside of the walls and for he first coat of the outside walls was composed f 5 parts Portland cement, 1 part hydrated me paste, and 12 parts sand. After the cement nd lime had been thoroughly mixed to uniform olour, the sand was added, and the whole orked with water until evenly mixed.

The first coat of this plaster, with the ddition of long cow-hair, was applied to the thickness of ⅓ in. on the interior surface of the outer layer of lathing, and to the thickness of 1 in. on the exterior surface. The exterior plastering was scratched over to form a key for the finishing coat, applied as soon as the first coat had set hard enough to hold the second coat, which consisted of 1 : 2 Portland cement mortar 1 in. thick.

The interior layer of lathing was plastered with the cement and lime mortar trowelled to a perfectly smooth finish.

All interior partition walls are solid and consist of Hy-Rib lathing and plaster, the former placed with the ribs vertical.

The sheeting for partitions on the ground floor is let into grooves in the concrete dwarf walls and wired at the ceiling to spikes driven into the joists, or into furring pieces secured to them. On the first floor the sheeting for partitions which follow the direction of the floor joists is let into a rebate cut on the edge of each joist, the joists being doubled under the partitions. In cases where the partitions are at right angles to the joists the sheeting is wired to spikes driven into bridging pieces fixed between the joists for continuous support of the partitions.

The Hy-Rib lathing is stiffened by horizontal rib bars, $\frac{3}{16}$-in. size, spaced 30 in. apart, to which the lathing is wired.

The partitions are finished by plastering on both sides with cement and lime mortar to the total thickness of 3 in. and smoothly trowelled.

Grounds for the attachment of skirting-boards and frieze rails were spiked on both sides of the lathing before the latter was erected, the dimensions of the grounds being 3 in. by 2 in. by ⅞ in.

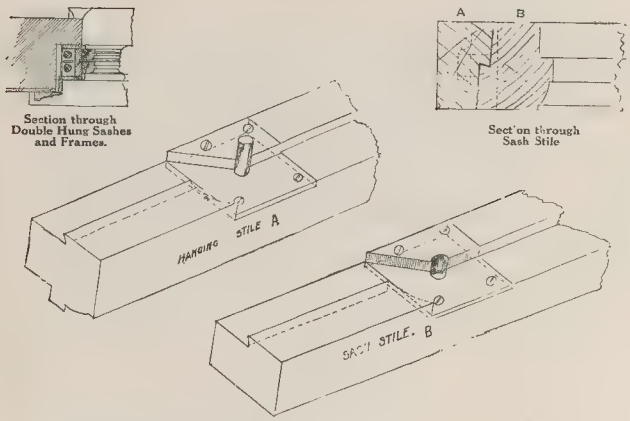
In solid concrete walls breeze concrete blocks were inserted where required as grounds for the attachment of joinery work.

The hearths on the first floor are of concrete. 3 in. thick, covered with tiles and laid on Hy-Rib sheeting.

The roof of the bungalow is constructed of timber in accordance with the details shown in Figs. 3 and 4, where also will be found particulars of the flooring and fittings generally.

The exterior walls are rough-cast, the mixture being slightly coloured with yellow oxide. The ceilings and exposed soffits of stairs in the interior are finished white in "Marblite" plaster.

The rapidity with which this mode of construction can be carried out is among its advantages, and from the drawings here reproduced the convenience of Hy-Rib lathing for work of the kind can be appreciated.



The Bovis Window.

THE BOVIS WINDOW.

WE show on this page a simple method of window construction which enables the outside of double-hung sashes to be cleaned from inside, and also to obtain a perfect form of ventilation.

The system may be explained briefly as follows: The sash stiles are made in two parts, as shown in the section; the slipper stile A is hung in the frame in the usual way, and the corresponding stile B is pivot hung to A with an ingenious stop action pivot which checks the sashes in the required position. The rebated and hook joint between the two makes it perfectly weathertight, and, being bevelled, it prevents friction in opening and closing.

By the very simple expedient of blocking out the head of the frame on the outside and the sill on the inside another considerable improvement is effected, as this causes the top sash when pulled down to clear the bottom sash and then open on its pivots for cleaning, so

Section through Double Hung Sashes and Frames.

Section through Sash Stile

The Bovis Window: Details.

that the necessity for steps to reach the top sash is entirely obviated. A great feature of the arrangement is the entire absence of any loose parts, which are apt to get mislaid; in fact the only fittings required other than the pivots before mentioned are a pair of slides constructed upon the principle of Shadbolt stays, which hold the sash in any position required when used for ventilating. As a result the window is extremely easy to operate, and the simplicity of the construction makes it almost impossible to get out of order.

The invention marks a great advance in window construction and we predict a great future for it, especially as the proprietors, Bovis, Ltd., Upper Berkeley-street, London, W., have wisely decided not to restrict the manufacture of the window to themselves, but only stipulate that, in all cases, the pivots must be procured from them. It is, however, their intention to supply these at such a price as not to make any appreciable difference in the cost of the window.

CONSTRUCTION NOTES.

Sprayed Walls. A RECENT German patent is for plastering walls by spraying. The principal characteristic feature in the invention is that the mortar or plaster is brought under pressure to the place where it is applied, and then sprayed by compressed air upon the surface to be covered. The process is adaptable for making partitions where woven wire is stretched on frames; also for covering walls where "wire lathing" and the like is employed. The mortar or plaster, brought to the proper consistency with water, is pumped through a pipe or hose ending in a nozzle, through the centre of which there is a pipe for the compressed air. The wall thus bespattered with plaster must necessarily be slicked off. Where partitions or thin outer walls are made by plastering on woven wire this is backed up during the spraying by a suitable board or other surface, which is removed as soon as the layer on the front side is sufficiently thick and firm. Then when requisite the other side may be similarly treated. The patent also calls for the use of compressed carbonic acid gas instead of air, the object being to hasten the setting of the mortar or plaster.

Relative Values of Metals for the Water-supply Pipes of Houses. MR. O. KRÖNKE, in the German Journal of Gaslighting, discusses the use of galvanised-iron pipes and zinc pipes as substitutes for lead pipes in house water systems, and arrives at the following conclusions:—As regards the solvent action of water upon galvanised-iron pipes, several micro-photographs are given showing the irregular and blotchy character of the zinc coating produced by different methods as compared with the even character of the surface of a block zinc pipe.

Experiments were made upon the amount of metal taken up by tap water from a block zinc pipe, and the highest amount found after eighteen hours' standing was 3·5 milligrammes per litre, equivalent to 25 grains per hundred gallons. In simultaneous experiments with galvanised piping, it was found that after a few hours only traces in general were taken up from each kind of pipe, but after several days or weeks about twice us much zinc was taken up from the galvanised pipe as from the block pipe.

It is concluded that galvanised pipe is a better pipe than one of lead from the hygienic standpoint, as the amount of zinc dissolved is below the limit of injuriousness. The amounts dissolved depend upon the nature of the water, temperature, and time of contact, and upon the nature of the coating. Block zinc pipes are superior to galvanised pipes in that the surface is uniform in structure, and there is no question of the strength or adherence of the surface coating.

Alnwick Augmented Waterworks. THE Local Government Board have approved the scheme for augmenting the water supply of Alnwick. Copious springs in Alnwick Park, near Hulne Abbey, will be tapped, the water conveyed to Canongate, where it will be pumped into a high-level reservoir near Swansfield Park. The supply into the town will be divided into upper and lower services. The estimated cost of the scheme in round figures is about 7,500*l*. The engineers for the scheme are Messrs. Taylor & Wallin (Mr. Harry W. Taylor, A.M.Inst.C.E.), of Newcastle-upon-Tyne and Birmingham.

Damage to Concrete by Contact with Acids. E. NEUMANN quotes in the *Toninder Zeitung* for 1912 a number of cases in which concrete drains have suffered greater or less damage, some of them in comparatively short periods from the time of their construction. In every case the destructive action was traced to the presence of acid in the water which had obtained access to the drains, either internally or externally.

In one instance the soil—said to be swampy—surrounding the drain contained iron pyrites, and the water became charged with sulphuric acid. (Pyrites heaps are in use in different parts of England as sources of copperas, and the liquid drainage is known to contain free acid by its corrosive action upon iron pipes laid near these heaps.)

In other instances the atmosphere inside the drains became heavily laden with sulphuretted hydrogen, which slowly oxidised to sulphur and sulphuric acid.

Although sulphuric acid was the most frequent and also the most potent destroyer of underground concrete, other mineral and organic acids, such as hydrochloric, oleic, acetic acid, etc., and also carbon dioxide were found to be almost as harmful. Mr. Neumann concludes that the destructive action of acids is due to two causes, viz.: (1) The formation of certain calcium and aluminium compounds, especially calcium sulphate (gypsum), which is accompanied by a large increase in volume: (2) the formation of soluble compounds, especially calcium bicarbonate, which go into solution and cause the concrete to collapse.

The chief remedies proposed are: (1) To provide adequate ventilation inside the drains: (2) to use as basis for the concrete, dense, non-porous clinker poor in lime; (3) to cover the exposed surfaces of the concrete with a coating of tar; or, best of all, for protecting from external agencies, (4) to lay the foundations of the drains upon tar, felt, or asphalt, impervious to acids.

The Softening, Purification, and Sterilisation of Water. IN the eighth research Report of 1912, addressed to the Metropolitan Water Board, Mr. A. C. Houston describes a new method of sterilising water by the addition of excess of lime, and in the case of a hard water of softening it at the same time.

Most of the experiments were made with raw Thames water with the object of sterilising it and only incidentally of softening it. Commercial quicklime containing about 75 per cent. of oxide of calcium was used, and the death of *Bacillus coli communis* in 10 cubic centimetres of water was taken as indicating the destruction of disease germs. It was found that one part of quicklime to 5,000 parts of water had little effect on the *B. coli* present in one hour, but after five hours nearly all the bacilli were killed, and in twenty-four hours they were completely killed in forty-two out of forty-three experiments. The excess of lime present over that required to combine with the free and semi-combined carbonic acid in the water varied from five to ten with an average of seven per 100,000, and it is this quantity which produces the germicidal effect. With water to which was added 1 per cent. of sewage a dose of lime of one in 5,000 killed practically all the *B. coli* in twenty-four hours, but a weaker dose of one in 7,500 was insufficient. It was found that the excess of lime present could be removed by adding to the treated water one-third or more of its volume of untreated water, the free and semi-combined carbonic acid in which neutralises the excess of lime. The effect on the hardness of the water was that, using lime to the amount of ten per 100,000, the total hardness was reduced from 22·36 to 11·03, and using fifteen per 100,000 the reduction was from 23·82 to 8·42.

In using the method on the London water supply, the untreated portion used for removing the excess of lime would be that which had by adequate storage been rendered bacteriologically safe, so that the result would be that the whole water would be safe bacteriologically, and at the same time it would have lost about fifteen parts of its hardness. It would only remain by rapid filtration to secure chemical purification of the water and removal of the precipitated calcium carbonate. When the method is applied to well water the portion of the water used to effect neutralisation of the excess of lime would have to be sterilised previously by chlorine, ozone, or other suitable means. With soft waters the whole of the water would be treated with excess of lime; in this case about two per 100,000 was found to be sufficient, and the excess removed by suitable means—*e.g.*, carbon dioxide or aluminium sulphate.

Injury to Cement "Rendering." WHAT is regarded as possibly a unique experience has been observed in the coating of cement used for rendering watertight a newly-constructed tank at the Newbury gasworks. The tank is to be used for storing tar and ammoniacal liquor; but before putting it to use the "rendering," which apparently was well set, showed defects. These, when examined, were seen to be small holes, through which a yellow gelatinous substance was being forced, assuming curious worm-like shapes and movements on the face of the wall. On closer inspection, and removing by picks the skin of the cement, it was found that grains of oats and other cereals had become mixed therewith and, fostered by warmth and moisture, had begun to germinate.

The source of the mischief is probably grains of horse fodder dropped from the bags of the teams that brought the sand to the site.

THE BUILDING TRADE.

THE INSURANCE ACT.—II.

IN our last article we endeavoured to give employers some idea of their position under Part II. of the Insurance Act elating to Unemployed Insurance by considering to what trades or employments the ct applied, what was a "workman" within is part of the Act, and what were the mounts to be contributed, but other points main to be considered.

The employer, in the first instance, has to pay oth the contributions of himself and the orkman; how is the employer to recoup imself?

Sect. 85, subsect. 3 provides "Except where e regulations under this part of the Act therwise prescribe, the employer shall, in the rst instance, be liable to pay both the contriutions payable by himself, and also on behalf and to the exclusion of the workman, the ntribution payable by such workman, and ubject to such regulations shall be entitled, otwithstanding the provisions of any Act or any ntract to the contrary, to recover from the orkman by deductions from the workman's ages, or from any other payment due from him the workman, the amount of the contributions paid by him on behalf of the workman."

This subsection is rather typical of modern gislation, for it will be seen that it leaves the mployer in uncertainty as to his obligations ntil he has ascertained in what way they are odified by any regulations. Schedule III. ntains "Rules as to payment and recovery contributions paid by employers on behalf employed contributors," but these rules re limited in their application to Part I. of the ct—Health Insurance.

We are not aware that any special regulations ave been issued under this part of the Act lating to this question, so it would appear that he regulations referred to in sect. 85, subsect. (3) re certain general provisions contained in the ct to which we shall refer below, and such as ct. 97 referred to in our former article, but *rimâ facie* the employer is liable, in the first nstance, to pay the workman's contributions, nd he must recover the same from the workman. nder this subsection it will be observed it is rovided that "notwithstanding the provisions f any Act"—*i.e.*, such as the Truck Acts—or any contract to the contrary," the contributions paid for the workman can be deducted om any wages or any other payment due o the workman. This is the only special eans of recovery specified by the subsection, lthough subsect. 4 provides that the employer's ntributions payable on his own behalf all neither be so deducted nor recovered from ie workman by "any legal process." It oes not appear whether, if the employer eglects to stop the workman's contributions ut of his pay, any legal process is open to the mployer for their recovery, so employers on very account should be careful to deduct the ums due from the workman.

There are certain provisions in the Act nabling the employer to obtain a refund, nd we will now consider these sections. y sect. 94 when a workman has been conuously in the employer's service for a alendar year or other prescribed period of welve months and not less than forty-five ntributions have been paid during that eriod, the employer may apply to the Board Trade within one month of the expiration the period for a refund of one-third of the ntributions so paid. The Unemployment nsurance Regulations made April 25 deal ith such applications, and by rule 23 the eriod is defined as the period of twelve months nding on July 14 in any year. By subsect. 2 sect. 94 the Board of Trade may, for the urpose of meeting any change in the period, pply the provisions of the section to a less eriod.

Sect. 96 is of a more complicated character; relates to refunds in respect of workmen orking short time, and it seems to offer a remium to employers who in such circumances have paid contributions without ecovering from the workmen their contributions. he section provides that "if any employer atisfies the Board of Trade that during any period of depression in his business workmen employed by him have been systematically working short time and that during such period he has paid contributions under this part of the Act on behalf of such workmen as well as on his own behalf without recovering such contributions from such workmen either by way of deduction from wages or otherwise than in accordance with regulations made by the Board of Trade, he may claim such a refund of both classes of contribution as in the circumstances may seem just, "provided that, except in a case where the working of short time has been effected by stopping the work for some day in the week which has been usually recognised as a working day of at least four hours in the trade and district, no such refund shall be made in respect of any workman for any week in which the hours of work have exceeded five-sixths of the number usually recognised as constituting a full week's work at that time in the trade and district."

By subsect. (2) the employer can obtain a ruling of the Board of Trade as to whether a reduction of hours he proposes to make will satisfy the section.

This section is full of difficulty and will probably be resorted to very little, for it is not apparent why an employer should go against what has been understood to be the principle of the Act and pay the workmen's contributions himself. The rules made under this section throw no light on its provisions. Whether or not the fact that an employer chooses to work the requisite short time will be accepted as proof of the "period of depression" is by no means clear, but it is rather implied by subsect. (2).

Sect. 99 contains some important provisions with respect to workmen engaged through Labour Exchanges, but as the matters dealt with in the section are largely left to be carried into execution by Board of Trade regulations these regulations have to be considered at the same time. Shortly stated, the section provides that an arrangement may be come to between an employer and the Board of Trade in respect of workmen engaged through a Labour Exchange or in the employer's employ at the date of the arrangement, whereby the duties laid upon the employer under this part of the Act shall be undertaken by the Labour Exchange, and whereby "in respect of such workmen different periods of employment, whether of the same workmen or different workmen, may for the purposes of the employer's contributions, but not for the purpose of a refund of any part of the employer's contributions be treated as a continuous employment of a single workman." The advantages offered by this section are somewhat difficult to grasp.

Under subsect. (2) a workman under such an arrangement can treat all employment by one or more employers as continuous employment and can claim a refund, but in the case of the employer it is specially provided that the section shall not apply to refunds—*i.e.*, that the advantages offered by sect. 94 for continuous employment shall not be applicable. It is somewhat curious that an arrangement which seems optional to the employer alone should be made directly advantageous to the workman, who can exercise no option, an arrangement which may lead to discontent and even strikes, and the section seems introduced in the interest of Labour Exchanges. Except for the saving of some trouble to the employer in licking stamps and collecting "unemployment books," the advantage to the employer seems small. Under Schedule VIII. the contribution for a workman employed for a week is 2½d. (see our last article). If the period of employment is two days or less, for one day the contribution is 1d., for two days 2d. Thus, if different workmen were employed either for one or two days in a week of six days the maximum contribution of the employer is 6d., and the saving to the employer under this section would therefore be 3½d. But this is taking an extreme case of a constant change of workmen, and on the principle of *de minimis non curat lex* this elaborate machinery in respect of small deductions seems almost absurd. Under the rules a sum under this section has to be deposited with the Board of Trade, and by rule 34 the right of deduction of the workman's contributions under sect. 85, subsect. (3) is preserved, "unless the arrangement otherwise provides." In this rule there is also a curious provision that, if in the case of workmen employed through a Labour Exchange by one or more employers the aggregate amount of the deductions made in respect of any workman is in excess of the amount which would have been deducted if he had been continuously employed by one employer, the workman shall be entitled to apply for a refund of the excess.

In our last article we professed our inability to elucidate the complicated provisions of this measure with any satisfactory results, and in the present paper we have been able to do little more than indicate some of the obligations imposed and the rights conferred upon employers under this part of the Act. We have so far confined our observations to the rights and duties of employers and have not referred to the provisions of the Act relating to workmen.

STRIKES: COLLECTIVE BARGAINING.

THE announcement made in the House of Commons by the Chancellor of the Exchequer that the National Council of the National Transport Workers Federation unanimously agreed to a resolution endorsing the principle "of joint boards with monetary guarantees from both sides to ensure the carrying out of agreements" may possibly indicate a new departure in enforcing agreements which represent the result of collective bargaining and prove a means of averting continual strikes. There are, however, many difficulties to be surmounted. The trade unions generally are federated, with the result that if a dispute arises between any employer and his workmen the federations take up the quarrel and in consequence very often a general strike ensues. But the employers, with few exceptions, are not federated, and they exercise no control one over the other. The Government at the moment are advocating a federation of employers as a panacea for the present trouble, and if this course were adopted there would be two federations—one of employers and one of employed—who, it is assumed, would be able to come to agreements binding both bodies by contracts enforceable under penalty.

Such is the scheme, and we offer no opinion either for or against it, but there are obvious difficulties in the way of its accomplishment.

The men are not engaged in complex transactions involving credit and extending over long periods; each individual has only his labour to sell and he joins a union or is compelled to join a union for complex reasons. It is a matter for regret that too often the main reason for his joining is "peaceful persuasion" and the refusal of the unions to allow him to dispose of his labour unless he does join.

With employers it is different. They are in a sense not such free agents. They are hemmed in by the obligations of their contracts and trade rivalry with firms not in this country.

If they are to form federations, are they to exert "peaceful persuasion" on recalcitrant members? If a firm breaks away from the federation, what possible means can be exerted to bring it into the federation. A firm cannot be deprived of sick pay or strike benefit. Lastly, even were such federations possible in future, would not such a policy lead to the creation of huge trusts—a thing any Government would strongly discourage? Federations of employers on one side and of workmen on the other as long as things go well might come to arrangements, but what would be the condition of affairs in times of industrial war? There seemed to be an impression in the House that the Trade Disputes Act would prevent any agreements with monetary guarantees from being enforced. We think this is a misapprehension of the terms of that Act; but another point is of greater importance, which is that the provisions of that Act apply equally to unions of employers as to unions

of men, and the Courts have no jurisdiction over either in respect of torts committed in contemplation or furtherance of trade disputes. In the case of two federations pitted against each other in industrial warfare, the terms of this statute would permit a condition of affairs which would disgrace any civilised State.

REGISTRATION OF TITLE.

THE Land Registry has issued a Memorandum "on the facilities afforded by the Land Transfer Acts for cheapening and simplifying dealings with land."

Our readers are already aware that this is a highly controversial subject, but for further information we can refer them to the Report of the Royal Commission, which we commented upon in our issue of March 31, 1911.

Of course, the registration of "absolute title" is that which confers the greatest advantages, but we notice that in this Memorandum it is only defined in general terms as meaning "a safe holding title," which conveys little either to the mind of the layman or the lawyer, and it is a significant fact that, according to the Memorandum, but between 2,000 and 3,000 such titles have been entered since 1908.

The other forms of registration of title, "good leasehold title" and "possessory title," have far less advantages. The former merely guarantees the leaseholder's title to the lease, and the latter does little more than secure the form of conveyance, the accuracy of plans, etc. Registration of possessory title is that which has alone been made compulsory in the County of London. The Memorandum points out that there is no reason why nine-tenths of the purchases registered in London should not be registered with absolute title, as the ordinary titles favoured by solicitors would generally suffice. Land owners and lawyers, however, never care to go beyond what is absolutely necessary

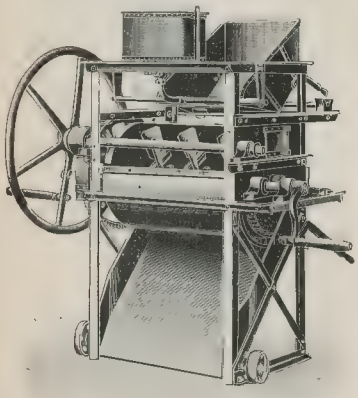


Fig. 1. Tilting Trough Mixer, operated by hand.

in relation to titles to land, for, of course, minute examination may result in some flaw being discovered, and, besides, there is the additional expense. It is urged that registration cheapens land transfer, but to the purchaser of land this is a somewhat abstract advantage. If he intends to hold the land it is a matter of indifference to him whether when the land eventually comes to be sold the purchaser will incur a little less cost. If, however, he is buying to sell, an easily investigated title may slightly enhance the value of the land, but to such a small degree that the purchaser is hardly likely to consider it in naming a price he will give. In the Report of the Royal Commission it was stated that the justification for compulsory registration was that it was for the good of the community that the transfer of land should be facilitated. The individual owner can hardly be expected to consider this aspect of the question, and the new land valuation has thrown so many difficulties in the way of a speedy and inexpensive transfer of land and buildings that it can only be concluded that the Government has lost sight of the principle aimed at by the Land Registration Acts.

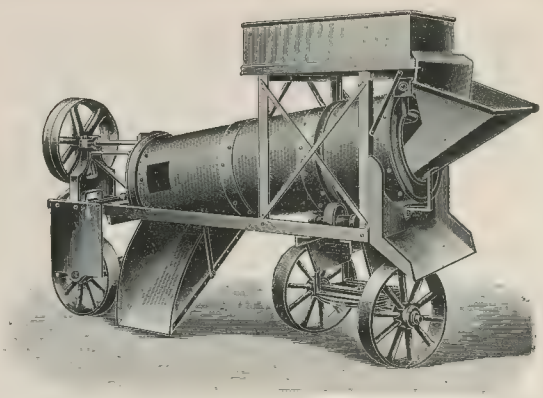

Fig. 2. Drum Mixer, operated by power.

It is stated in the Memorandum that the object of the Acts was registration with absolute title, yet it is also admitted that it would be obviously impracticable to compel registration of absolute title in all cases, and hence that compulsory registration has been limited to possessory title and therefore has not yet effected much relief as regards land transfer. This is perfectly true; and the Memorandum aims at encouraging land owners voluntarily to go further, but for the reasons given above we hardly think that the system will prove popular.

CONCRETE-MIXERS:

GASPARY MIXERS.

IN order that our readers may have before them for comparison with British types of concrete-mixing machines some particulars of German plant for the same purpose, we now give illustrations and brief notes on some of the machines made by the firm of Dr. Gaspary & Co., of Markranstädt, near Leipzig.

Fig. 1 shows a tilting trough mixer operated by hand, also supplied with fast and loose pulleys for operation by belting. If desired, the machine can be arranged so as to permit a barrow to be run under the trough to receive the mixed concrete.

The trough is fitted with paddles; the materials are tipped into the trough from a loading box, and water is supplied from an automatic tank.

This machine is made in three sizes with the effective capacities of 2·25, 2·9, and 3·5 cubic ft. per batch, and it is recommended for use in the manufacture of cement goods where small quantities of well-mixed concrete are required. The materials are mixed dry and then wet.

Fig. 2 illustrates a continuous type rotary drum mixer made in three sizes of from 4 to 6·5 cubic yds. capacity per hour.

This is a well-known form of mixer and need not be described in detail. It is supplied by Dr. Gaspary & Co., either on wheels as shown or without wheels for stationary use.

Fig. 3 represents a simple type of the funnel dish mixer, another continuous machine made in eleven sizes ranging in capacity from 1½ to 24 cubic yds. per hour.

The hoppers, for reception of cement, sand, and aggregate, are placed above the trough, which is provided with a mixing screw, the proportions of the materials being regulated automatically by a special device in each hopper, operated by gearing connected with the driving shaft.

Machines of the larger sizes can be supplied on wheels for transport from place to place, and fitted with hoisting apparatus and other accessories.

The Gaspary "Universal" continuous mixer has a rotating drum and mixing paddles moving in a direction opposite to that of the drum, but by reversing a lever the drum and paddles can be caused to move in the same direction. This and the measurement of materials are special features of the machine, which can be used as a batch mixer if desired.

Another type of the "Universal" mixer made for batch mixing only has an open trough fitted with revolving blades.

The "Universal" mixer is made in sizes capable of turning out from about 160 to 1,440 cubic ft. of concrete per hour.

BUILDERS ACCIDENT INSURANCE, LTD.

AT the thirty-first ordinary annual general meeting of the Builders Accident Insurance, Ltd., held at Nos. 31 and 32, Bedford-street, London, W.C., Mr. T. F. Rider (Chairman of the company) presided, and moved the adoption of the report and accounts for last year. He said that the increase in premium income over 1910 was about 800*l.*, which would have been considerably more but for the decreased amount of wages insured in consequence of slackness in trade. The dividends on investments were the same, but the interest on deposits was less in consequence of the lower bank rate prevailing last year than in the previous one. Turning to the other side of the account, the sum paid in settlement of claims, commission, and expenses was nearly 30,000*l.*, of which more than 16,000*l.* represented cases arising in previous years, and the trouble and expense of dealing with which—and in fact with all claims—became increasingly difficult. The development of industrial disease, notably that of lead poisoning, was one cause of a large increase in the number of claims, which, so far as the latter case was concerned, had now reached the point of practically insuring almost every painter's life.

Mr. H. H. Bartlett seconded the motion, which was adopted.

On the motion of Mr. E. M. Sharman, seconded by Mr. E. Rider, the retiring directors, Mr. H. H. Bartlett, Mr. F. J. Dove, and Mr. T. F. Rider were re-elected; and on the motion of Mr. Vigor, seconded by Mr. Deputy Pitman, the directors' fees were fixed at the same amount as last year.

Mr. F. L. Dove, L.C.C., was then elected a director of the company. Mr. Charles Fox was re elected auditor.

Votes of thanks to the Chairman for presiding and to Mr. C. M. Brown, the Secretary,

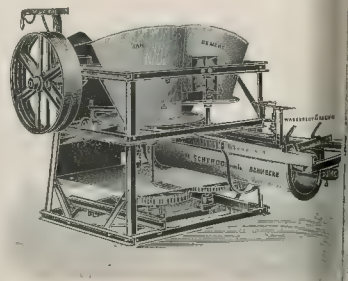

Fig. 3. Funnel Dish Mixer.

nd staff for their efforts during the past year ere accorded, and the proceedings terminated. The report mentions that after allowing sum for depreciation of investments of 91*l.* 9s. 11d., the funds of the Association tand at 20,793*l.* 10s. 5d., as against 0,505*l.* 17s. 10d. at December 31, 1910.

A BUILDING TRADE UNION.

A REPRESENTATIVE meeting of the building rade unions has been called by Mr. C. W. owerman, M.P., for June 21, to be held in ondon, for the purpose of considering a eport, recommending the amalgamation of the rade unions of the building industry. The nion is to be called the Amalgamated Build- ng Workers' Union, and its objects will be umite all workmen in the present building ade unions into one union, embracing the hole of the workers with a view (1) to main- in a fighting organisation, working to nprove the material conditions of the workers the building trade; to take joint action ith other similar unions in the furtherance the interests of the workers, nationally and sternationally, believing that the interests of wage workers are identical. (2) The rstematic organisation of propaganda among e workers, upon the necessity of becoming rganised on the industrial field, upon the asis of class instead of craft; and organise ir industry as workers instead of by sections craftsmen. It is also to provide for trade rposes a uniform scale of benefits, and the malgamation of the friendly society benefits to a separate account.

GENERAL BUILDING NEWS.

PARISH CHURCH, ABERDEEN.

The John Knox Parish Church has been lected at a cost of about 7,000*l.* from the signs of Messrs. Wilsons & Walker, archi- cts. The building has seating accommoda- on for 1,800 people, and below the church is large hall, which will hold between 700 and 0 persons. The contractors for the work re:—Masons, Messrs. Findlay & Henderson; rpenters and ironwork, Messrs. Leslie & ay; slaters, Messrs. Archibald & Leslie; lumber and gasfitter, Mr Worling, Gallow- te; plasterer, Mr. William Masson; inters, Messrs. Gordon & Watt; electric ghting, Aberdeen Electrical Engineering mpany. heating, Messrs. Mackenzie & oncur, Edinburgh.

CHURCH, PENDLETON.

Mr. F. C Oakley is the architect for the w church which is being erected to take the ace of St. Anne's Church, which is now too all for the district. The new building will at 500 people, and the organ and other ings from the old church will be used in the nishing of the new building.

NEW AISLE, CAERWENT CHURCH.

The new aisle in Caerwent Church, which is recently been dedicated, was built from designs of Mr. G. E. Halliday, F.S.A., chitect, of Cardiff, and the work was ecuted by Mr. W. Clarke, of Llandaff.

GIRLS' SECONDARY SCHOOL, LANCASTER.

These new buildings, which are being erected a site in Dallas-road, Lancaster, have been signed by Mr. Henry Littler, the County chitect, and the estimated cost of the ection of the school is 15,325*l.* The school ovides accommodation for 282 girls in nine ssrooms, and there are also cookery, science, d chemical departments.

TRAINING COLLEGE FOR THE POTTERIES.

t is proposed to erect a Central School of ience and Technology at Stoke-on-Trent, at estimated cost of 20,000*l.*, and the plans the building have been jointly prepared Mr. J. Hutchings, the Staffordshire County chitect, and Mr. S. B. Ashworth, Architect the Stoke-on-Trent Education Committee. e school will be primarily for the instruc- n of students in pottery, mining, and general ience, but provision will be made for future ensions for instruction in mechanics, ctrical engineering, and other crafts. The ntract has been secured by Mr. Thomas dwin, builder, of Hanley.

TOWN HALL, HULL.

The members of the Hull City Council met the Council Chamber of the new Town Hall the first time on Thursday in last week. e building, which is not quite completed, estimated to cost about 150,000*l.*, and has n designed by Mr. T. E. Cooper, F.R.I.B.A., of London. The Law Courts upy one-half of the building, and the other it will contain the municipal administrative artments.

TRADE NEWS.

Under the direction of Mr. Thomas Davidson, A.R.I.B.A., Great Ormond-street, W.C., Boyle's latest patent "air-pump" ventilators have been applied to Torquay Municipal Buildings, Torquay.

The new schools, Birlingham, are being supplied with Shorland's patent exhaust roof ventilators by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

In addition to having recently supplied two of their D. O. Boyd double-ward stoves with porcelain-enamelled casings and ventilators to the new Isolation Hospital, Shepton Mallet, Messrs. O'Brien, Thomas, & Co., of 17 and 18, Upper Thames-street, E.C., and Excelsior Works, Rollins-street, Old Kent-road, S.E., have just supplied four of their D. O. Boyd single-fire independent ward stoves with descending flues and porcelain-enamelled canopies, etc., to the new Sanitary Hospital, Boscombe, Bournemouth. Several of their improved pattern grates have also just been supplied to the Kingston Union Infirmary.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

BIRMINGHAM.—Premises, Bracebridge-street; Messrs. Crouch, Butler, & Savage, architects, 39, Newhall-street, Birmingham. Bakeries, Goode-street; Mr. Victor Peel, architect, 15, Temple-street, Birmingham. Factory, Soho; Mr. T. Silver, architect, 120, Soho-hill, Handsworth, Birmingham. Hotel, Bule-street; Mr. J. Turton, builder, 1, Wheelers-road, Birmingham.

Blaina.—Enlarging Blaina and District Hospital; Mr. E. A. Johnson, architect, St. Mary's-chambers, Abergavenny.

Blyth (Northumberland).—Drill hall (3,000*l.*); Messrs. Graham & Hill, 6, Eldon-square, Newcastle-on-Tyne.

Bolton.—Additions to Sunnyside Mill, St. Helen's-road, Daubhill, for Messrs. Tootal, Broadhurst, Lee, & Co., Ltd., cotton goods manufacturers; extensions to Mortfield Bleach Works for Messrs. T. E. Smith & Son.

Bo'ness.—Offices, East Pier-street, for the Bo'ness Investment Company, Ltd.

Bordesley Green (Birmingham).—Factory; Mr. W. H. Gibbs, builder, King's Heath, Birmingham.

Brampton. Residence; Mr. T. W. Dickinson, architect, Scarborough.

Bridlington.—Houses, Watson's-walk; Mr. E. R. Matthews, Surveyor, Town Hall, Bridlington.

Bristol.—Children's home, Fishponds; Mr. J. Bevan, architect, Liverpool-chambers, Corn-street, Bristol.

Bromley.—Proposed baths (12,000*l.*); Mr. S. Hawkings, Engineer, Town Hall, Bromley. Roman Catholic School, Freelands (120 places); Rev. Walter Cooksey, Bromley.

Burslem.—Alterations and additions to workhouse (2,865*l.*); Mr. G. M. Sambrook, builder, care of the Clerk, Guardians' Offices, Burslem.

Burton Latimer.—Public hall, etc., The Cross; Secretary, Co-operative Society, Burton Latimer.

Burton-on-Trent.—Drill hall; Mr. G. Hodges, builder, Homington-street, Burton.

Bury.—Offices, Roach Bank Mills, for Messrs James Kenyon & Sons, Ltd., cotton spinners.

Castletownbere. — Twenty-nine houses (4,850*l.*); Surveyor, Rural District Council Offices, Castletownbere.

Catshill.—School (500 places); Mr. A. W. Priestley, Shire Hall, Worcester.

Chelmsford. Empire, Springfield-road, for the Chelmsford Empire and Hippodrome Company, Ltd.

Chorley.—Additions at bleach works, Lower Healey, for Mr. J. T. Holt.

Coventry.—Three branch libraries (8,638*l.*); Mr J. E. Swindlehurst, Surveyor, Town Hall, Coventry Silk mills; Mr. H. Quick, architect, 64, Hertford-street, Coventry.

Cowes.—Drill hall; Messrs. Nair & Bucknill, architects, Portland-place, Southampton.

Crowland (Lincs).—Twenty houses; Surveyor, Rural District Council Offices, Crowland.

Daisyfield (Bury).—Extensions and alterations to Egyptian Mills, Wellington-street, for Messrs. Milnes Brothers & Hoyle, cotton goods manufacturers.

Devizes.—Conversion of premises, Market-place, into picture hall; Messrs. W. E. Chivers & Sons, builders, Devizes.

Dumfries.—Motor works for Messrs Arrol-Johnston, motor-car builders, Paisley.

Dunblane.—House. St. Margaret's-drive; Messrs. Christie & Davidson, architects, Post-Office-buildings, Dunblane, Perthshire.

Dundee.—Enlargement of St. Patrick's Roman Catholic School (4,000*l.*); the Trustees. Offices, King-street, for Messrs. Low & Bonar, jute goods merchants, 5, King-street, Dundee. Proposed school for cripples; Dundee School Board.

Dunfermline.—Enlargement of Opera House; Mr. H. Hare, Oldham.

Durrington (Salisbury).—Church; Messrs. S. Hyde & Son, architects, Eniswell-street, Worthing.

Earlstown.—School, Paterson-street (10,145*l.*); Messrs. D. A. Ablett & Sons, builders, 2-8 Sovereign-road, Wigan.

Eastbourne.—The following plans have been passed:—Addition, Catholic Church, Meads-road, for the Rev. P. Lynch; Mr. F. A. Walker, architect. Alteration, The Lamb Inn, for Messrs. Harvey & Son; Mr. A. Ford, architect; Messrs. M. Martin & Sons, builders. Addition, The Hydro, Mount-road, for the Hydro Hotel Company; Mr. J. W. Woolnough, architect; Mr. Thos. Dunlop, builder. Six houses, East Dean-road, for Mr. J. Vine, Mr. W. R. Box, architect; Mr. J. Vine, builder. Alteration, The Lion Inn, Seaside, for Messrs. Harvey & Son; Mr. A. Ford, architect. Manor farm, of 235 acres, realised 3,900*l.*

FOREIGN AND COLONIAL.

Trade Conditions in Nova Scotia and New Brunswick.

Building throughout the Province of Nova Scotia has been brisk, and the brickyards have been working to full capacity. Several new industries were started during the year, and a carriage company at Kentville added an automobile branch. Building operations in New Brunswick generally have been active throughout the Province, especially so in Campbellton. Moncton also has had an active year in building, the completion of the Intercolonial Railway workshops, the commencement of the Grand Trunk Pacific workshops, and the erection of several factory buildings, street car buildings and dwellings, having given a considerable amount of work.

Building, etc., Works, Ceylon.

The *Ceylon Observer* (Colombo) of April 25 publishes particulars of the extraordinary expenditure of the Public Works Department of Ceylon for 1912-13, the chief items being as follows:—

Public works, Rs. 2,585,151. New public works and buildings, Rs. 625,636; additions and improvements to buildings, Rs. 480,949; road construction and improvement works, Rs. 632,777; construction and repair of bridges, Rs. 329,440; miscellaneous works, Rs. 493,659. Irrigation, Rs. 320,531. Railways, Rs. 1,684,890. New machinery for Locomotive Department, Rs. 65,375; new 60 ft. turntables, Rs. 41,124; new engine shed and yard at Nawalapitiya, Rs. 75,000; laying of 80 lb. rails on Polgahawela-Kurunegala section and on Northern line, Rs. 367,559. Provision amounting to Rs. 5,716,633 has been made on account of works chargeable to surplus balances, including a sum of Rs. 1,235,000 to be expended on the deepening of Colombo harbour. Rupee = 1s. 4d.

OBITUARY.

Mr. S. Smirke, F.R.I.B.A.

The death, on June 5, at his residence in St. John's-road, Richmond, Surrey, is announced of Mr. Sydney Smirke, aged seventy years, formerly of Teddington, and of Craig's-court, Charing Cross. Mr. Smirke was the son of Sydney Smirke, R.A., Gold Medallist, 1860 (*obiit* 1870), and nephew of Sir Robert Smirke, R.A., Gold Medallist, 1853 (*obiit* 1867), Sir Edward Smirke, the antiquarian (*obiit* 1875), and Richard Smirke, the antiquarian and draughtsman (*obiit* 1815)—the sons of Robert Smirke, the painter, who died in 1845. Mr. Sydney Smirke was elected a Fellow of the Royal Institute of British Architects in 1888, and served upon the Literature Standing Committee for several sessions. He was a member of Council, Architects' Benevolent Society, and retired by rotation in March, 1904; in 1887 he became a member of the Architectural Association.

Mr. E. J. Milner Allen.

We regret to announce the death from pneumonia of Mr. Edmund John Milner Allen, after an illness extending over only a few days, at the age of fifty-two. After studying at the Royal Academy of Arts, where he was a Silver Medallist in 1880, he was elected Associate of the Royal Institute of British Architects in 1882 (extra Silver Medallist, Soane Medallion, 1883), and commenced practice in 1884. In addition to numerous and varied works, both alone and with the late Mr. Arthur B. Gibson, he was joint architect, with Mr. J. W. Simpson, of the Liverpool City Hospital (South); the Victoria Institute, Worcester; the Glasgow Fine Art Galleries, Kelvingrove Park (admittedly one of the finest specimens of modern architecture in Great Britain); and the Cartwright Memorial Hall, Bradford.

Mr. R. Morham.

The death, on June 5, at his residence, No. 13, Lauder-road, Edinburgh, is announced of Mr. Robert Morham, aged seventy-three years, who in 1873 was appointed City Architect and Superintendent of Works to the Edinburgh Corporation, and in May, 1903, retired from that office, through superannuation. Mr. Morham, a native of Edinburgh, received his professional training in the offices of the late David Rhind and David Bryce, and for a few years practised in London with Mr. W. Eden Nesfield. When twenty-seven years of age he returned to Edinburgh and became chief assistant of Mr. David Cousin, then the City Architect. Mr. Morham's principal work for the Town Council comprised the extension, initiated in 1896, of the City Chambers; the central fire-station; Colinton Mains Fever Hospital for 600 patients; shelters, pavilions, and promenades in West Princes-street Gardens, and in West Meadows and Saughton and Roseburn Parks; New North Bridge and other improvements; the new bridge from Gorgie-road to Saughton Park, constructed wholly of reinforced concrete, and the Waverley and Gorgie Corn and Cattle Markets, with new abattoirs, roads, etc. (1907-8); the public baths (1893-4); the West Port police and fire stations (1883); Portobello baths, and Simon-square, St. Leonard's, and Stockbridge baths and washhouses, and Dalry baths (1901-7); extension, for 125,000 volumes, of the Public Library, George IV. Bridge, and Maconochie's Close, Cowgate (1902-3); Morningside branch public library (1904-5); public library, police-courts, and alteration and conversion of the municipal buildings, Portobello (1906); Bowl House, West Meadows, mortuary and disinfector buildings, High Schools yards, and electricity power-station, Macdonald-road (1903-5); Stockbridge and Torpichen police and fire stations (1906-8); alterations and improvement of the committee-rooms, City chambers (1905); and the North

Berwick Infectious Diseases Hospital (1900). In 1906 Mr. Morham, jointly with Mr. Pittendrigh Macgillivray, R.S.A., prepared plans for the new art school; he also made plans, in 1904, for the Usher Hall. He read a paper, "Suggestions on Fever Hospital Construction," to the Congress at Aberdeen of the Royal Institute of Public Health, reported in our columns of August 18, 1900.

Mr. H. C. Whaite, R.W.S.

Mr. H. Clarence Whaite, of Kensington, who died on June 5 at his country home, Tyddyn Cynal, in Conway, was born in 1828 in Manchester, where he entered the School of Design. He then studied in Lee's School, Newman-street, London, and the Royal Academy. For many years he was a regular contributor of landscapes to the Royal Academy and the Manchester Royal Institution Exhibitions; he was founder and first President of the Royal Cambrian Academy, and a co-founder, and latterly President, of the Manchester Academy of Fine Art. The mountain scenery of North Wales supplied many a subject for his pictures, which since his election into the Royal Water-Colour Society were, for the most part, painted in that medium.

Mr. C. R. Wells.

The death took place recently, at his residence, 226, Westmorland-road, Newcastle, of Mr. Charles R. Wells, a retired builder and contractor, who had reached the age of eighty-two years. Mr. Wells was a native of Cromer, Norfolk, and went to Newcastle between fifty and sixty years ago. He commenced building in the west end when that portion of the city comprised green fields, and erected houses in Park-road, Bell terrace, and Choppington-street, eventually finishing on the Beech-grove estate. He had lived in retirement about sixteen years.

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

May 8. By KNIGHT, FRANK, & RUTLEY.

Pendleton, Lancs.—Pendleton Estates (f.g. rents and chief rents) £79,000

May 22.—By STOOKE & SON.

Contractions used in these lists.—F.g.r. for freehold ground-rent; l.g.r. for leasehold ground-rent; i.g.r. for improved ground-rent; g.r. for ground-rent; r. for rent; f. for freehold; c. for copyhold; l. for leasehold; p. for possession; e.r. for estimated rental; w.r. for weekly rental; q.r. for quarterly rental; y.r. for yearly rental; u.t. for unexpired term; p.a. for per annum; yrs. for years; la. for lane; st. for street; rd. for road; sq. for square; pl. for place; ter. for terrace; cres. for crescent; av. for avenue; gdns. for gardens; yd. for yard; gr. for grove; b.h. for beerhouse; p.h. for public-house; o. for offices; s. for shops; ct. for court.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not

PRICES CURRENT OF MATERIALS.

*** Our aim in this list is to give, as far as possible, the *average* prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

THE ARCHITECT IN UTOPIA.

IT is sometimes said that the architect of to-day—who is innocent of so many unjust charges laid at his door—is too much wrapped up in the past, that his tastes and his studies alike tend to make him little more than a pedantic copyist of historic buildings.

For once one feels inclined to admit the impeachment, albeit with the usual reservations. So-called architectural "revivals" have a way of repeating themselves with tiresome monotony—the Neo-Classic, the Gothic, the Italian Renaissance, the Queen Anne, and so on—till one can almost prophesy the date when the next Gothic Revival is due. And woe-be-tide the man who refuses to recognise those waves of popular taste, for one must be as up-to-date with architectural modes as any slave of fashion with her fluctuating head-gear.

Meanwhile most of us emulate the ostrich in our outlook on the universe. We bury our heads in Gibbs's "Rules for Drawing" or Paley's "Gothic Mouldings" just as drowsy dons dull their perceptions in musty combination rooms while the world rattles on unheeded outside.

Aeroplanes and wireless messages are whirling round us, industrial upheavals shake the ground we stand upon. The Futurists shout and scream with pen and brush—and we take no interest in their doings.

Not very long ago, in an architectural contemporary, one of our younger writers broke the spell, like the Prince in the fable, and ingeniously discussed the position of our art from the convenient view-point of an aeroplane!

Surely it is time that we took stock of another eventuality which is becoming more feasible in the minds of some talented folk nowadays—that strange dim shadow of a universal Utopia forming the inspiration of so many interesting books during recent years.

Let us, then, play for a while at the children's eternal game of "Supposing."

There is no more gifted exponent of this game than Mr. H. G. Wells, and, though he may interest us in his tales of Mars and of the Moon, he is never so enthralling as when he takes a look ahead in this strange and wonderful world. In one of his most popular books he outlines his theory of the ideal Socialist

State, gathering up the many divergent threads of various thinkers before him.

Reading this "New Worlds for Old" the selfish thought came into the present writer's head that it was difficult to foresee how his own profession would be affected if a wave of some magician's wand suddenly landed Utopia in our midst. Would architecture gain or lose by the sudden transformation? Will it gain or lose if the ideal State is to come in the slow processes of many years?

On the one hand, we have the idealists, enthusiastic and confident, assuring us that Utopian England will become very nearly an Earthly Paradise, a long succession of spacious vistas and ordered cities; on the other, we find the cynics with their prophecies of deadly uniformity. The Right to Work—the opportunity for genius—is a plank in every idealist's platform, while his critics never fail to remind him that genius will be stifled and swamped in the awful monotony of an official-haunted existence.

Now in the actual progress of architecture at the present moment may be seen all the beginnings of a more scientific civilisation. In its widest aspect it becomes what we of to-day have learned to call town planning, and town planning has rapidly taken its place among the concrete facts of modern life. It is indeed a tacit recognition by all political parties of the advisability of the State undertaking a reform which has previously only been dabbled in by a few public-spirited landowners and employers of labour in this country. And this is neither more nor less than an admission of the Socialist doctrine in one direction.

Mention of building by-laws would bring one down from the clouds with a clatter and a rush, but even these barbarous efforts—savouring of bumbledom and the old vestry days—show that a need is felt for controlling the individual in the interests of society. In the same way might be mentioned a whole list of those increasing restrictions upon architecture which are in the main for its own good and which are nevertheless capable of considerable modification.

So that any development of control in the future could have no very alarming possibilities in store for us—rather a gentle tightening of the screw upon the extremist, the unqualified man, and the jerrybuilder, all of them probably the better for it.

The change would indeed be far more marked in the status or condition of the architect himself than in the abstract side of his craft. Architecture would probably progress rapidly in many ways with the elimination of the speculator and the State regulation of the greater part of building. An enormous demand would arise for small houses planned on the latest hygienic lines, tastefully designed, and situated with a view to convenience and fresh air. A new type of model flat would probably be evolved with facilities for communal cooking, while the public buildings in every centre of population would be as numerous as they were magnificent.

All of which is eminently satisfactory as a general proposition, and moreover is eminently reasonable. Call it Socialism if you like, call it civic pride, or democracy. There is no doubt that England of to-day in order to beautify her cities needs, above everything else, more of this keen corporate spirit to replace the trumpery selfishness of the suburban Londoner and the clutching rapaciousness of the alien speculator.

"The modern architect knows," writes Mr. Wells, "we might build ourselves perfectly clean, smokeless, magnificent cities to-day, as full of pure water as ancient Rome, as full of pure air as the Engadine, if private ownership did not block the way."

Yes, and the modern architect—Socialist though he be—knows that for the major part of his income he is dependent on that same system of private ownership!

Will he find his niche in Utopia as one of that vast army of officials whom most cities of Socialism forecast in their warnings, or will his independence be preserved? Is this new Earthly Paradise to be a bureaucracy or a happy hunting-ground for wayward genius? Who, in fact, will be the architects and how will their work be carried on?

Mr. Ramsay Macdonald, another well known authority, takes the extreme case of a poet and defends the position of this worthy person in the ideal State as being on the whole better than it is at present.

One confesses to a certain scepticism in regard to the financial position of the versifier of to-day, and would rather discuss a more ordinary being—the practising architect. He cannot display his plans in quite the same way as the poetaster declaims his verses to a gathering of immortals such as Mr. Macdonald describes in the Golden Age of the Edinburgh Select Society.

He will probably be reduced to a choice of two evils in place of his present condition of alternate boot-licking and futile attempts at competitions. He may become a public servant, or he may remain in a mild and emasculated way a private adventurer. Public service for architects is, of course, no new thing, and the conditions of this class are not likely to change very radically. Entrance will probably be entirely by competitive examination, and there will be less difference between the salary of the Superintending Architect and his juniors than now prevails, but the chief alteration will be in the immense increase of work which will come under the *ægis* of the municipality or the local authority. Dairies, bakeries, coal offices, and breweries will be designed by these new city architects of to-morrow, while railway-stations will also be a national affair. The new civil servant may have to work harder than his prototype of to-day, and he will probably be better educated both generally and technically for his work, but he will remain a comfortable, easy-going, perhaps enviable person with his pension and a jog-trot life.

Socialist writers, however, are generally in difficulties about the man who is not a State official. They all agree that ability will be recognised and honoured, every man getting his fair chance. Carried to its logical conclusion, this axiom implies a public competition—perhaps an international competition—for every scrap of building that is proposed. Then, of course, the best man wins, and what is more he goes on winning, so that we get no nearer to universal brotherhood. The second-best man remains second-best, and receives a small premium; while the man placed fifth gets nothing at all, and back we come to earth. It might be possible to penalise a man who wins too many competitions, making him "go back to the beginning," as in some old-fashioned parlour games of hazard.

Socialism is to destroy our modern competitive system, we are told, and yet in some mysterious way to ensure the triumph of genius and virtue, though the two seldom go hand-in-hand. It is to be the day of the virtuous small man, as Mr. Wells calls him, in a virtuous small house, and the millionaire "must come down to a simpler and in many material aspects less distinguished way of living."

Architecture in Utopia would undoubtedly advance enormously. With the ordered magnificence of Paris we should combine the charm of the Garden Suburbs already so rapidly springing up, and a modified form of that restraint which prevents London County Council tenants from keeping rabbits in their drawing-rooms would do us little harm.

But for the architect himself, with his curiously blended repertoire of talent and servility, an unknown future opens, and we agree with Mr. Wells and Mr. Macdonald that much work is necessary to render Socialism a practical proposition in matters of detail.

NOTES.

Manchester Old Town Hall.

THE efforts of Mr. Edgar Wood, the ex-President of the Manchester Society of Architects, and of numerous architects and other public-spirited citizens who have followed his initiative, have resulted in the decision of the City Council to rebuild the façade of the Old Town Hall in one of the public parks of the city. It seems incredible that a prosperous community like Manchester will not be at the public expense to retain so fine a specimen of its architecture as was the Old Town Hall, but that a condition of its rebuilding should be that half the cost should be privately contributed. It is, therefore, the greater honour to those of its citizens who answered Mr. Wood's appeal and have saved the façade in the face of the passivity of an indifferent public. It is a pity, however, that having decided upon the rebuilding of the façade, the Council has been hampered by an indifference no longer passive, and prevented from carrying out the scheme well. When, after much consideration, an excellent site had been decided upon—the spacious area of Platt Fields—and the dignified scheme which we illustrate on p. 715 prepared by Mr. Edgar Wood, there appeared numbers of angry residents in the district so jealous of their open spaces that the colonnade as an entrance gateway on a frontage hundreds of yards wide was described as blocking the view; and an ignorant opposition to what was really an ideal site, with arguments which would have applied equally well to Decimus Burton's arch or the Arc de Triomphe, was allowed to prevail. A much inferior site has been found in Heaton Park, near a new lake in process of construction. It

is now to be hoped that the opportunity thus presented of bringing the lake and the façade into one scheme of formal treatment will not be lost. Then Manchester will not only have preserved the best work of the finest period of her architecture, but she will have redeemed from utter dulness the very uninteresting sheet of water and some of the other incongruities of Heaton Park, and have made its surroundings more worthy of the stately mansion hard by.

The University of South Africa.

NOT the least potent evidence of plutocratic existence will be forthcoming to posterity from the endowments created by the millionaires of the present day. We have in mind the bequests of the late Lord Wandsworth and Mr. William Whiteley. The latest example of public-spirited forethought is provided by the legacy of a quarter of a million pounds sterling left by the late Sir Julius Wernher to the Union of South Africa to assist in building and endowing a University at Groot Schuur, near Cape Town, where, it will be remembered, Mr. Herbert Baker built a home for Mr. Cecil Rhodes, himself a wise contributor, notably in the case of Oriel College, Oxford, to the cause of scholarship. Sir Julius Wernher, who, a year or so ago, was awarded the Gold Medal of the Institution of Mining and Metallurgy for his services in connexion with technological education, also left over 100,000*l.* to the Imperial College of Science and Technology, South Kensington. Added to the Alfred Beit funds for the furtherance of education in South Africa, the Wernher bequest will enable the University to be established on a firm foundation, and we look forward to the possibility of a competition for the design of a building worthy of the future needs of the country. Sir Julius, we believe, materially assisted the project of founding an Art Gallery at Johannesburg, now realised in the building designed by Mr. Lutyens. He certainly gave to the new institution many works of art in co-operation with Mr. Otto Beit, Sir Lionel Phillips, Mr. Michaelis, and others; while in our own National Gallery he has filled a blank space by the presentation of Watteau's "La Gamme d'Amour." By such memorials the far-seeing financier who died last month helped to guarantee the progress and enlightenment of mankind, and in using his wealth so wisely he justified his accumulation.

The Advertisements Regulation Act.

IT is announced in the *Times* that the Local Government Committee of the London County Council are recommending the Council to frame a by-law prohibiting the exhibition of any advertisement within 40 yds. of 108 scheduled open spaces in such a way as to be visible from such open space, and in a second schedule thirty open spaces are specified from which it is proposed to protect the views from disfigurement by advertisement. We welcome this action on the part of the Committee, but it may well be asked, why has any step in this direction been so long deferred? Section 2 of the Advertisements Regulation Act, 1907, provides that a local authority in seeking by-laws under the Act shall provide for the exemption of any hoarding and similar structures in use for advertising purposes, and of any advertisements exhibited at the time of making the by-law for a period of not less than five years. The Act was passed in August, 1907, and we understand that there has never been any difficulty in framing by-laws with reference to specific places or spots, although there has been difficulty in protecting the scenery generally along our roadsides. Seeing the long period that must elapse before the by-laws where made can purge our scenery from existing disfigurements, it is difficult to see why nearly five years have been allowed to elapse before making by-laws which cannot be fully operative for a further period of five years. Mr. Richardson Evans has already stated that the Japanese have shown more enterprise than our own local authorities in dealing with this question.

PICTURE EXHIBITIONS.

AMONG modern art crazes there is none perhaps which can be justified upon more reasonable grounds than the craze for the Russian ballet. To artists, of all kinds, and more especially, we daresay, to those who practise architecture, it has been a source of pure delight. The dancing, perfect as it is after the traditional Italian manner, forms only part of an ensemble in which design, decoration, colour, and costume equally share. The pleasure to the architect is in the artist's realisation of appropriate and harmonious surroundings for the action and movement of the stage, which, in a certain degree, also provides an interesting problem, even in the most prosaic aspects of the more serious art of architecture. The names of the various dancers—Nijinksy, Karsavina, Pavlova—have become as familiar to London audiences as those of the actors who have won their Knightly spurs in British comedy; but the name of the designer of the scenery and costumes of such brilliant fantasies as Schéherazade and Cléopatre was practically unknown. It can remain so no longer. M. Léon Bakst is neither Futurist, Divisionist, Troglodyte (if we may include the latest exponent in new movements!), nor Russian dancer, but his drawings now on exhibition at the galleries of the Fine Art Society will secure attention for all that. He is, we presume, a Slav; his feeling for colour and form is Oriental—that is to say, it is decorative and sensuous without being decadent. His work may be compared in some of its aspects to the productions of both Beardsley and Mr. Gordon Craig; it possesses the decorative quality of the one and the romantic feeling of the other, while technically it is free from the mannerisms which are so often mistaken for style in art, but which are more frequently due to the artist's limitations as a colourist or draughtsman. M. Bakst's imaginative conceptions are not limited by any lack of technical training or facility in handling his materials; his artistic range is extensive, and he is a master in the interpretation of the decorative forms of Eastern and ancient art. A good deal will no doubt be heard of him within the next few weeks.

The name of Alphonse Legros is probably better known than his work; it is largely connected with art teaching. Although a Frenchman, the greater part of his life was spent in England. He was eminently successful, we understand, as a teacher; the quality of his pictures suggests that his professorial influence must have been also eminently individual. Legros's art was not affected by his residence in England; its essence and spirit were always French. He was somewhat of a mystic, keenly in sympathy for the most part with the men of the Barbizon school. The memorial exhibition of the work of Alfred Stevens recently held at the Tate Gallery has now been followed by a similar exhibition devoted to the work of the later artist. It would be impossible perhaps to get together a more adequately representative collection of his work than the Director of the Tate Gallery has secured on the present occasion. Legros's practice of oil painting was, we should infer, somewhat intermittent. The sixty examples on view cover dates as distant as 1853 and as recent as 1905; a certain uniformity of idea runs through the whole series, just as a consistent outlook on life and nature is expressed in all his art, while his execution, always intensely sincere, shows a variety of influences. Legros as a painter, as an etcher, as a sculptor is sombre; his sympathies in regard to various aspects of life leave him, even in his landscapes, a little sad. But he is never sentimental; his feeling for the poor, for the peasant, for the children of toil was too profound to contain any mawkish element. Probably his period of highest achievement in oil painting was between the years 1865 and 1890. "Le Baptême," which belongs to 1869, the "St. Clement of Alexandria" (1870), and "The Pilgrimage" (1871) must, at any rate, be counted among his best work. His etchings are more generally familiar than his oil paintings, while his portraits and drawings of heads remain masterpieces in their kind, both in regard to execution and the interpretation of the character of his subjects.

The International Society provides a large and representative exhibition of contemporary British landscape in the second instalment of their annual show at the Grafton Galleries. It is a little curious, however, that a small water-colour by the first President of the Society, Mr. Whistler, should be relegated to a place below the line, while numerous landscapes by Mr. Walter Greaves are given places of distinction—to which, be it said, their merit certainly entitles them. Past contemporary masters, if we can use the expression, are represented by Watts, Cecil Lawson, and Buxton Knight, while among the modern men we find Mr. Hughes Stanton, Mr. Rothenstein, Mr. Lavery, and many others well represented. Mr. Cayley Robinson's "Dawn" shows very distinctly the influence of Puvis de Chavannes. We were glad to notice two pencil drawings by Professor Selwyn Image, whose pencil and water-colour, or tinted, drawings are seen too rarely at general exhibitions. There are also some landscapes by Legros which go to supplement the collection at Millbank. The exhibition contains much brilliant work, but, as a whole, it is disappointing. Probably this large array of landscapes wanted some relief, or else the various works were conceived, with some rare exceptions, without the decorative quality which makes landscape in a promiscuous collection possible. The repetition of pretty much the same sort of effect, however various the means, makes for a restless, unsatisfactory kind of dulness if the visitor cannot find other qualities for admiration than the merely technical in his voyage of discovery.

APPOINTMENTS VACANT.

A meeting will be held on Thursday, July 11, for the election of a Diocesan Surveyor or Surveyors for the Diocese of London. Particulars may be obtained from Mr. F. H. Lee, No. 1, The Sanctuary, Westminster, S.W.

The London County Council invites applications by June 22 for the following positions:—Teacher of Architectural Drawing for one evening a week at Camberwell. Applicants must be skilled draughtsmen and be architects in practice. Fee, 12s. 6d. an attendance. Teacher of Architectural Design and History of Architecture on two evenings a week at Putney. Fee, 15s. an attendance. Candidates must have had teaching experience and be architects in practice

TEMPORARY EXHIBITION BUILDINGS.

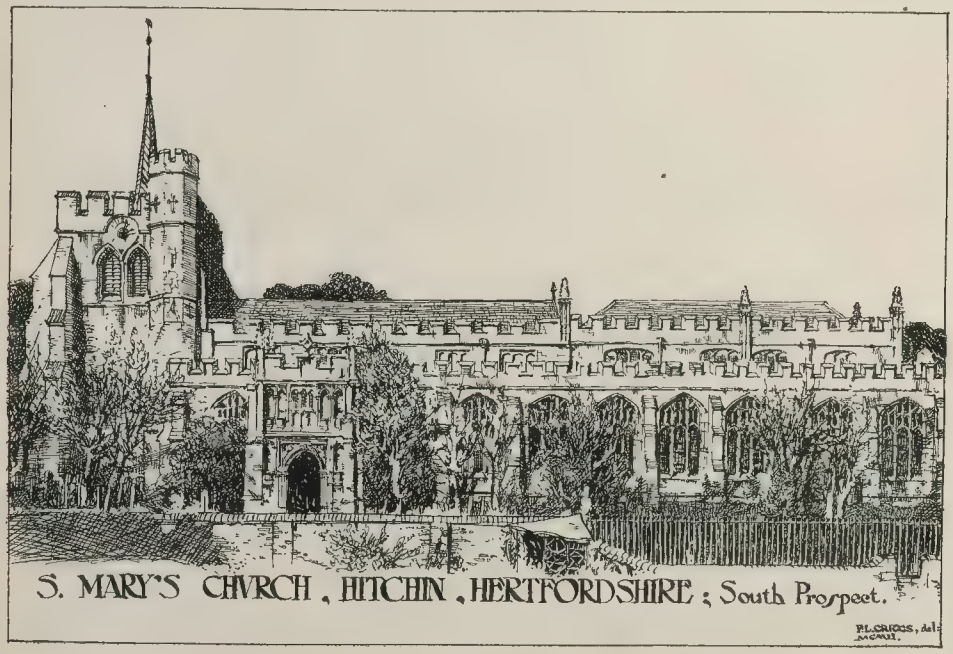
YEAR by year more consideration is being given to the design and construction of temporary exhibition buildings, and the standard is undoubtedly being raised. In these days of rush and bustle the thinking public are learning more and more to appreciate the old-world feeling of repose which permeates any studied representation of mediæval buildings, streets, and market-places, even though they be carried out in nothing more massive than slabs of fibrous plaster. And this harking back to the olden days in exhibition grounds is not confined to England. We well remember "Old Düsseldorf," at the Brussels Exhibition of 1910, to say nothing of earlier attempts on the Continent, and great expectations are aroused by the announcement that at the International Exhibition of the Building Trades to be opened at Leipzig in May, 1913, numerous buildings representing the city at the time of the War of Liberation will be erected. The old gates and fortresses, and the old Plassenburg, as well as many other streets and courts, will be seen once more. Provided these "structures" are entrusted to men of scholarly knowledge and artistic feeling, the result should be well worth seeing, and a visit to Leipzig should be instructive, seeing that the exhibition will apparently afford a wide range of interest to all concerned with the constructive and decorative arts.

At Earl's Court, at the present time, may be seen in "Shakespeare's England" what can be done in the way of reproducing old architecture in plaster, aided by a judicious use of colour. Some of the "Tudor buildings" there set up are quite excellent, and, as far as we know, ahead of anything that has been previously attempted in this country as regards thoughtfulness of detail.

In the matter of scale only do they disappoint, and to one who is familiar with the originals, be they in the streets of some busy town or hidden away in the wilds of the country, it is at first sight somewhat disconcerting to find that the scale has been reduced, doubtless owing to the exigencies of exhibition building. Nevertheless, there are Tudor houses in "Shakespeare's England" which even the expert can look upon with pleasure, and which cannot fail to enlighten the public mind and to be something of a revelation to those who have not the opportunity to see the originals for themselves.

We hope to illustrate some of these ingenious reproductions of old work in a subsequent issue.

THE ARCHITECTURAL ASSOCIATION:



SECOND SUMMER VISIT.

A LARGE number of members left King's Cross on the 15th inst. for the all-day visit to Hitchin and neighbourhood, under the guidance of Messrs. Walter Millard and Geoffry Lucas. On the way from the station to the town the Girls' Grammar School, built in 1908 by Mr. Edward Burgess, of Leicester, was seen in passing. This is a fine block which masses well from the entrance lodge, but the daring change in storiation on either side of the central feature of what at first glance seems a symmetrical front is startling. The detail is good and quiet and the materials pleasing. Descending "Windmill Hill," whence a fine panoramic view of this typical country town may be had, a visit was paid to St. Mary's Church, where Mr. Millard, with the aid of careful plans prepared from time to time by himself and Mr. Lucas, explained the growth of the existing fabric. It appears to be almost entirely of XVth-century date, but a careful analysis assisted by excavation at several points during the course of recent reparations convinces Mr. Millard that the nave and tower occupy the position of a church of the mid-XIIth century, and that at the angles of the nave walls and in the base of the tower, portions of this structure remain. The tower arch and its strengthened abutments are of the XIIIth century; the nave arcade and aisle walls follow next in date, apparently the early XIVth century, the angles of the original east end being perhaps of similar age, though an additional bay was projected eastward, without moving the altar, in the XVth century, when also the chancel arcade was rebuilt, practically all the windows in the church were remodelled, and the fine north and south porches built, giving an appearance of XVth-century character to the whole building. The broad low proportions of the tower, with its typically Hertfordshire leaded spirelet, give a strong note of character. The nave was restored by Sir Gilbert Scott, and the chancel (rather destructively) by Sir Arthur Blomfield, who built a false inner roof and crammed the altar back against the east wall.

A short time remained for a walk round the streets of the old town; this is not the place for an historical description—interested readers may discover this (and admire some fine drawings by Mr. F. L. Griggs) in "The Royal Manor of Hitchin and its Lords Harold and the Balliols." A flying visit was paid to the new Town Hall—an early work of Mr. Lucas, in conjunction with the late E. W. Mountford.

After luncheon at the "Sun," a drive of about three miles brought the party to Poynder's End, a good-sized house by Mr. Lucas. Perched on the swelling crest of a considerable hill overlooking a wide stretch of country, the prospect thus commanded has had some influence on the planning. The house is quite informal in design, a freely developed picturesqueness and interesting detail giving it its architectural qualities. The principal rooms face south-east, on which front overlooking the garden are three spacious two-storied bays (unevenly spaced) and a shady loggia. The living hall at the north end is a charming room, white panelled and with broad open fireplace. Its massive chimney and an additional lead-covered bay at the north-west angle group well on the end overlooking the hillside. Future extension at this end was contemplated in planning. A very massive staircase is a striking feature of the interior.

Near at hand is Temple Dinsley, where, on the nucleus of a pleasant little Georgian house Mr. E. L. Lutyens has grafted a mansion quite in his best manner. The attractive name of course suggests the previous existence of a Preceptory of Knights Templars, but of this no trace remained. Mr. H. W. Tompkins F.R.Hist.S., writing in 1902, described the house as "just such a homestead as an Englishman might be expected to love." It is that still, though more than three times the size of the house he saw, but it is something more—it is a work of which all Englishmen might reasonably be proud. Mr. Lutyens' absolute mastery of material is nowhere better seen, nor is the plan lacking. Simplifying and remodelling the old house, which remains intact as a centre block to the new, Mr. Lutyens has projected a long wing one room thick on either side, making an H plan with the old house slightly lengthened each way as the cross-piece

S. MARY'S CHURCH, HITCHIN, HERTFORDSHIRE; South Prospect.

FL. GRIGGS, del. MCMXII.

the projections partly enclosing a forecourt (completed by walls and railings) on the south or entrance front, and a terrace overlooking gardens on the north. The principal new rooms are in the west wing, and their articulation to the old plan is at once simple and ingenious. A wide corridor from the staircase hall leads to an octagonal garden hall in the centre of the new west front, which is axial with the old kitchen-garden. Right and left of this open the drawing-room and smoke-room, the former with white-painted panelled walls and flush cabinets between the windows and the latter more boldly panelled in unpainted pine, limed and dull polished. The other new wing and the buildings to the eastward are chiefly occupied by the kitchen and servants' quarters, and in this direction a further extension just completed gives a nursery wing above an open arcaded basement. On the upper floor of the new wings are several bedrooms; a most beautiful bed of Mr. Lutyens' design fitly occupies one of them. After an exhaustive inspection of the interior an all too brief time remained for the beauties of the garden and exterior. The breadth and restraint which have been imparted to the new fronts and the slender means by which the whole effect is obtained make one marvel. Taking as units the suggestions offered by a rather unusual angle treatment of the old house, and its well-proportioned sash windows, Mr. Lutyens by mere disposition of masses and by the aid of some fine chimneys achieves his result—a thing as perfect in its way as can be imagined. By the kindness of Mr. Fenwick, members were allowed the free run of the house, and Mr. Thomas, with Messrs. Butt and Barnard, had brought drawings which, with their explanations, increased the interest of the visit. A large new block of farm buildings near by was hastily inspected before the return to Hitchin, where, after a walk round Mr. Phillips's antique furniture galleries at the Manor House, Bancroft, members returned to town with a consciousness of time well spent.

MESSRS. WHITELEY'S NEW PREMISES.—II.

(*Continued from page* 701.)

Fire-Resisting Construction.

Protection of Steelwork.—The exterior stanchions are encased in approved fire-resisting materials to the minimum thickness of 4 in., in accordance with the requirements of the London County Council, the nature of the materials employed varying with the position of the members to be protected. Interior stanchions are covered to the same thickness, as suggested by the County Council in view of the large areas of the various shops.

The girders are embedded in concrete, monolithic with that in the hollow block and reinforced concrete flooring.

Flooring and Terrace Roof.—All the suspended floors in the building, as well as the terrace-roof and the protection of the steelwork generally, were executed by the Fram Steel and Fireproof Construction Company, Ltd., of Westminster.

The floors represent a combination of hollow blocks and reinforced concrete. The blocks are of clay, carefully moulded and burnt, and have ribbed surfaces to furnish a key for the surrounding concrete and for plastering on the soffit. The blocks are situated in the lower part of the floor to conduce to lightness of construction, and to reduce the conduction of sound. Tensile stress is taken by steel rods embedded in the concrete or mortar joints between the blocks, and compressive stress is taken by the concrete above the hollow blocks, suitable provision being made in the form of stirrups for web stresses.

The concrete in the joints of the blocks is of superior quality, which is also employed in the compression area to the requisite depth for resisting the stress developed. In places where the floor spans are small the uniform thickness of 12 in. adopted is made up by a filling of low-grade breeze concrete deposited above the better class material required for withstanding compression.

The hollow blocks are arranged in different ways according to circumstances, some being placed side by side, and others in rows consisting of blocks laid flat alternating with blocks on end.

In some of the largest panels the joints are reinforced in two directions as an additional assurance of strength and safety.

The floor spans are of considerable extent, many of them measuring nearly 32 ft. square, and the largest 45 ft. by 30 ft.

The suspended floors and flat roof, which is constructed in accordance with the same method, represent an area of more than 5 acres, and were constructed in less than six months.

In order to achieve this result it was necessary for the contractors to work day and night for a period of about two months, one serious difficulty which had to be surmounted having been the delivery of materials with almost clocklike regularity, as in consequence of limited storage facilities it was impossible to keep supplies on the site in quantities providing for more than a few hours' work.

During the period of greatest pressure upwards of 2,000 sq. yds. of flooring were completed each week, involving the use of 25,000 hollow blocks and seven barge loads of sand and ballast, besides large quantities of cement and steel.

Division Walls and Fire Doors.—Owing to the fact that the cubical contents of the seven departments amount in each case to more than 700,000 cub. ft., it was necessary for the division walls to be 14 in. thick to satisfy the County Council, the steelwork being encased to the thickness of 4 in., as previously stated.

As openings through the division walls were absolutely necessary for the convenience of business, although contrary to ideal principles of fire-resisting construction, special care was taken by the architects to provide effective means of preventing the spread of fire from department to department in case of need.

As a first precaution, the steel framed bronze doors were fitted with Luxfer fire-resisting glazing, consisting of small panes of glass in copper framing, the same system of glazing having been adopted for the fanlights. Although not capable of prolonged resistance, this glazing would certainly withstand considerable heat for a reasonable time.

A further safeguard adopted for isolation purposes was the employment of fire doors and rolling shutters on both sides of every opening.

In the case of the smaller openings, tin-clad doors supplied by Messrs. Mather & Platt, Ltd., were fitted on each side, with an ample air space between them, the doors having spring hinges arranged so as to shut automatically in the event of fire breaking out.

The wider openings are protected by rolling doors or shutters supplied by the Wilson Rolling Shutter Company. This type of fire door construction was invented by Mr. J. G. Wilson, of New York, and provides an air lobby between the door or shutter on each face of the wall. The opening in the wall is always wider than the doorway and extends from the floor to the ceiling. A pair of light wing walls are built out from the opposite faces of the main partition wall as shown by the details below. The wing walls span the entire opening and the parts above the door openings are carried on lintels.

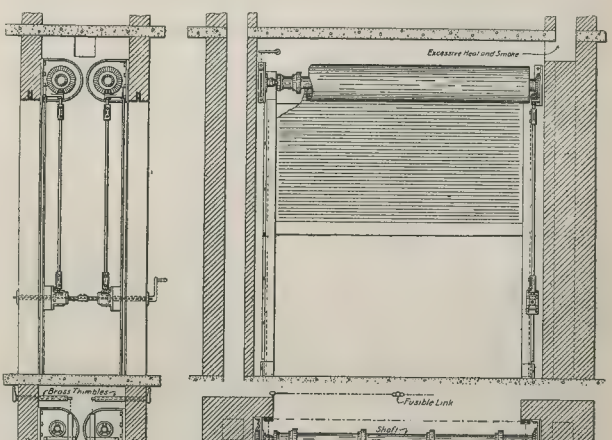
The roof of the lobby is of fire-resisting material, with an outlet at one end for the escape of excessive heat and smoke, and acting as a ventilator under normal conditions.

The rolling doors travel in metal guides at the sides of the opening, and are fitted so that they cannot be directly attacked by fire. The form of the guides ensures the close contact of the doors with the fire-resisting surface of the wall, and immediately above them are the metal housings for the support of the horizontal winding rollers.

The shafts on which the rolling doors are hung are hollow, and contain counterbalancing springs which hold the doors in the normal position, and when the springs are thrown out of action the doors close automatically. The springs are controlled by a flexible metal connexion having a fusible link, as shown in the plan. In case of fire, the link fuses, causing a tumbler to fall and thereby to throw out the control of the corresponding spring, with the result that the door closes by its own weight.

The doors can be mechanically operated by means of a key shaft extending through both walls and fitted with gearing as represented in the section.

Fire-Resisting Glazing.—Although the shop fronts are of plate-glass, the windows are enclosed by fire-resisting casings with Luxfer fire-resisting glazing, so that if a fire were to break out in any window enclosure the flames would not readily extend into the shop, as happened in the case of the Clapham Junction fire.



The Luxfer system of glazing has been applied also to all the windows throughout the establishment.

The domes comprise an inner and an outer shell, both glazed with armoured glass by the Challenge Glazing Company, Ltd., by whom also the steel framework of the domes was constructed. The domes comprise some 40,000 sq. ft. of glazing.

Some armoured glass roof lights have been fitted by Messrs. J. A. King & Co., Ltd., and the work executed by the Luxfer Company includes patent lantern lights, skylights, pavement lights, and lights in the fire-escape balconies.

Fire-Escape Stairs.

Apart from the safeguards provided by fire-resisting construction and fire-protection appliances, the new building is fitted with exterior balconies and escape stairs. These are accessible from every floor, and should afford ample means of escape in the event of an outbreak of fire.

Wilson Rolling Shutters.

Doors between the Departments at Messrs. Whiteley's New Premises.
(Showing Luxfer Glazing.)

The balconies and stairs were supplied by the St. Pancras Ironwork Company, Ltd., the treads and risers being of iron, perforated for the passage of light to adjacent windows, with the exception of those in situations where light is not a matter of importance or where non-slippery treads are required. The construction is in accordance with the regulations of the London County Council throughout.

Fire Protection Appliances.

Electro-Pneumatic Fire Alarms.—For the detection and notification of fire in any department of the building a complete system of the fire-alarms has been installed by the Acro Fire Alarm, Ltd., of London.

The installation comprises a system of small diameter copper tubing run in circuits along the ceilings all over the premises and connected with an indicator board on the ground floor.

In the event of fire the increased temperature of the atmosphere causes the air in the tubes to expand, and the pressure thereby created acts upon a sensitive diaphragm on the indicator board, making an electrical contact which denotes by an indicator the exact position of the outbreak, sets alarm bells ringing, and gives warning at the offices of Messrs. Whiteley in Queen Victoria street.

The alarm system is applied to the forty sections into which the building is divided, and includes about eight miles of copper tubing.

The apparatus is arranged so that gradual increases of temperature such as may be due to warm weather shall not be capable of operating the signals, and provision is also made to obviate false alarms due to sudden temporary rises of temperature. It also includes a testing device enabling the management to ascertain periodically whether the system is in proper working order.

Sprinkler Installation.—An extensive system of Grinnell sprinklers, supplied by Messrs. Mather & Platt Ltd., of Salford, has been fitted throughout the building.

The installation comprises about 3,500 automatic sprinklers supplied with water either from storage tanks, with the capacity of 6,660 gallons, or from the mains of the Metropolitan Water Board.

The horizontal lines of pipes are suspended from the ceilings in the basement and on the top story, and elsewhere are laid beneath the floor surfaces. These pipes are connected with the rising mains supplied with water at sufficient pressure to keep the entire system charged, except in sections where the Grinnell dry pipe system has been adopted as a precaution against frost.

The sprinkler valves are kept closed by a solder link, the melting-point of which is such that the metal will fuse at the temperature of 155 degrees Fahr.

Sprinkler branch pipes project from the inner face of the two domes at frequent intervals, and in addition there is a ring main around the outside of each dome, so that the whole of the glazing can be kept flooded with water in case of fire, the same arrangement being available for cleaning purposes. The ring mains are supplied with water from 2½ in. diameter service pipes.

Hydrant System.—In addition to the sprinkler installation the building is protected by a hydrant system, comprising rising mains of large diameter, with valves and hose-pipes ready for use for every floor. There is a rising main close to each of the staircases and the hydrants can be supplied with water either from the mains of the Metropolitan Water Board or from the steam fire pump in the engine-house. The system was installed by Messrs. Mather & Platt, Ltd., of Salford.

Lightning Protection System.—The lightning conductors on the new building were fitted by Messrs. Richard Anderson & Co., of Leadenhall-street, E.C., as briefly described below.

To the base of the steel flag-staff surmounting the tower over the main entrance a conductor of 1½ in. by ¼ in. copper cable was connected by means of bolts and solder. From the flag-staff the conductor was led to the back of the building and thence down the steel supports of stairways to earth, terminating with a 3-ft. square copper plate sunk to depth sufficient to bring it into contact with moist earth, and embedded in wood charcoal.

Two copper four-point terminals were attached to each end of the exterior lift building at the back, and connected up to the above-mentioned conductor, similar connexions being made between the main conductor and the rotunda dome and railings.

At the top of the timber flag staff on the corner turret a ball pointed air terminal was fixed with a conductor of 1½ in. by ¼ in. copper cable, carried along the parapet wall to the rear of the building, passing to earth down the steelwork of stairways, and terminating with a copper plate bedded down in the same manner as that for the conductor from the main flag-staff.

In each case the steelwork of the stairways was properly connected up to the copper conductor.

Four-point air terminals were fixed at the ends of the exterior lift building and on the ventilation head, and connected up to the conductor from the turret flag-staff, the steelwork of the octagonal dome and railings being also connected to the same conductor.

The dimensions of the main conductors were governed by the long horizontal runs on the roof, necessitated by the circumstance that the only place available for earthing was at the rear of the premises.

Lifts and Parcels Conveyors.

The new system of shopping prevailing in modern establishments of the type represented by the premises of Messrs. Whiteley entails the need for mechanical aids to locomotion such as will enable visitors to gain access to the upper floors without the labour of climbing stairways.

With this object in view ten passenger lifts have been installed in addition to eight goods lifts, two kitchen service lifts, and a very complete plant for the mechanical handling of goods and parcels, all these appliances being operated by electricity supplied from the generating station on the premises.

Lifts.—All the lifts were supplied by Messrs. R. Waygood & Co., Ltd., of London, and are of their most recent patterns

The ten passenger lifts are constructed to travel at the speed of 250 ft. per minute with a load of 20 cwt.

The cars are built of ornamental ironwork specially designed by the architects to harmonise with the interior fittings of the building, and the sides are closed with glazed panels.

In order to obviate crowding the cars are of spacious dimensions, each measuring 6 ft. by 5 ft. in plan. The guide rails for the cars and the counterbalance weights are of heavy section round steel bars, turned in the lathe to ensure smooth working, the cars and weights being fitted with adjustable gunmetal guides to work against the rails.

Beneath each car is attached a safety apparatus, to which the cables are fixed, this apparatus working in connexion with a patent slack cable gear on the crown bar above the car.

The appliances come into action automatically if any rope breaks or stretches unduly, or if any obstruction is encountered either by the car or by the counterbalance weight, the effect in any of these occurrences being to cut off from the machinery, and at the same time to prevent the descent of the car.

Special speed governors are also provided for operating the safety gear in case any lift should descend at excessive speed owing to any cause.

Mechanical and electrical locking gear is fitted to the gates at all landings to prevent the lifts from being started unless the doors are shut and to prevent the doors from being opened unless the cars are opposite the landing.

Each car is operated by means of a self-centring detachable handle, so designed that in the event of the attendant omitting to turn it to the "off" position when arriving at the top or bottom of the travel all current is automatically cut off, and in case the attendant should relax his hold of the handle the latter would automatically spring to the "off" position and thereby stop the car.

The winding gears are constructed with steel worms cut from the solid and worm-wheels with phosphor-bronze rims and teeth to ensure smooth and steady running, and the gears are fitted with double ball thrust bearings.

Each machine includes a winding-drum with two steel wire cables for the car and separate cables for the counterbalance weight, and has an automatic electric brake arranged so as to come into action automatically in case current should fail from any cause. The electric motors for operating the lift gears are of 17-brake-horse-power with the overload capacity of 50 per cent.

The eight goods lifts range in capacity from 10 to 20 cwt., and are constructed for operation at speeds of from 125 to 250 ft. per minute, the cages being from 6 ft. by 4 ft. to 8 ft. by 6 ft. 6 in. in plan.

These lifts have steel guides and guide rails and safety apparatus similar to those adopted for the passenger lifts, and are operated by handles in the same way. The gears are of different design, but the safety appliances are of the same type as for the passenger lifts. The cages are of steel with plain wood panels.

Inclined Parcels Hoist.—Between the basement and ground floor is a Reno moving stairway for elevating trolleys of parcels to the despatching-room at ground level. This stairway, which was fitted by Messrs. Waygood & Co., comprises an endless chain belt having teeth for engaging projections on the trolleys, and thus enabling the latter to retain their position on the inclined travelling-belt.

Parcels Conveyors.—To provide for the expeditious transport of parcels from the various departments of the new premises to the packing-room in the basement an ingenious system of conveying plant has been installed by Messrs. A. Sauvée & Co., of 60, Park-street, S.E. The installation includes five spiral shoots connecting the various upper floors with the basement. Parcels descending a spiral shoot are received on an electrically-driven conveyor or band, and delivered therefrom into a second shoot, whence they are deposited upon one of the two rotating sorting-tables for removal to the delivery vans.

There are about 350 ft. of conveyor belting, travelling at the rate of 3 ft. per second.

Boiler Plant and Generating Station.

The power plant is accommodated in part of the basement in the old portion of the Queen's-road building.

The boiler-house contains four Galloway boilers, each 30 ft. long by 8 ft. in diameter, fitted with Meldrum mechanical stokers, and two Lancashire boilers by Messrs. Adamson fitted with stokers of the Meldrum type.

The stokers are arranged for the use of low-priced fuel, the necessary draught being furnished by a chimneyshaft 160 ft. high, with the interior diameter of 8 ft. 6 in.

Steam is generated at the pressure of 120 lb. per square inch, and is passed through Galloway superheaters situated behind the boilers, the temperature being therein raised from 350 deg. Fahr. to 450 deg. Fahr.

The boiler feed-pumps are driven by steam, and motive power for the mechanical stokers is provided by Siemens type electric motors.

The plant for generating electricity has been enlarged to cope with the requirements of the new building, and now includes seven generating sets with the collective output of some 800 kilowatts.

Six of the sets have Willans & Robinson engines direct coupled to Lahmeyer dynamos, and the other set consists of a Belliss engine with Siemens dynamo. Current is generated at the pressure of 200 volts.

The main switch-board is at one end of the generating station, in an open position so as to be readily accessible on both sides.

Electric Lighting.

Current for the lighting of the new premises is supplied at the pressure of 200 volts from the generating station situated in the old part of the Queen's-road building, the supply mains being brought thence to two main switch-boards in the basement [of the recently-completed extension.

From the main boards seven pairs of sub-main cables are taken in steel conduits to feed the sub-main distribution-boards, one in the basement of each of the seven sections into which the new building is divided.

From the sub-main distribution-boards rising cables are taken to each floor as feeders for the iron-cased distribution switch-boards in the numerous departments.

The wiring for arc lamps and incandescent lamps proceeds from the distribution switch-boards, and, like all the cables, is protected by steel tubular conduits.

A noteworthy feature of the conduit system adopted is that it was specially arranged in such manner as to permit all the cables and wires to be drawn in after completion of the building. If necessary, any circuit, or all the circuits, could be drawn out with perfect ease, and without causing disturbance of the conduits, floors, or decorative finish of the building.

This ingenious system is a speciality of the electric-lighting contractors, who were one of the first firms to demonstrate its practicability and to adopt it exclusively in installations carried out by them.

As customary in the best modern practice, all wires throughout the building are in continuous lengths from point to point, thus obviating joints of any description.

The entire installation was executed by Messrs. H. J. Cash & Co., Ltd., of Westminster, and some notion of its extent may be obtained from the statement that the lighting system includes some twenty-four miles of copper conductor, more than a thousand arc lamps, and more than twelve thousand incandescent lamps.

The new shops are illuminated partly by arc lamps of the Brokie-Pell single-enclosed pattern and partly by incandescent metallic filament lamps, the latter being distributed in various places for the more perfect sub-division and uniform distribution of light.

In situations where the headroom is insufficient for the employment of arc lamps special 14-in. holophane pendants have been fitted. There are eighty-two of these, each containing a 200 candle-power 200-volt incandescent metallic filament lamp. These lamps and fittings were supplied by Messrs. Siemens Brothers Dynamo Works, Ltd., of London. The holophane bowl and shade is carried by a neat bronze ring with suspension chains in the same metal.

Holophane pendants of the pattern described are used exclusively in the jewellery department, and incandescent lamps are employed for the illumination of the restaurant and tearoom. Some tasteful examples of special electric light fittings were supplied by Messrs. J. W. Singer & Sons, Ltd.

The two large domes are illuminated by metallic filament lamps in the space between the inner and outer glazing.

The problem of lighting the shop windows was considerably simplified both by the architectural design and by the system of window-dressing which is favoured at the present time by the proprietors of large stores.

The practice in window-dressing formerly thought necessary involved the maximum utilisation of show space with the object of enabling prospective buyers to see a representative selection of the goods for sale inside.

An arrangement of the kind entails outside lamps combined with interior lighting, usually afforded by lamps suspended by flexible conductors. There are objections to this method, one in particular being the source of danger constituted by lamps hanging from long pieces of flexible cord.

The policy largely adopted by large drapery firms to-day is to arrange their shop windows in the most attractive manner possible and, abandoning the idea of making the outer display representative of all classes of goods on sale, to welcome the free inspection of their showrooms without permitting the least importunity on the part of salesmen and saleswomen.

The new premises of Messrs. Whiteley have been designed in general accordance with this wise policy, the result so far as concerns window lighting being that the old-fashioned arrangement of reflecting lanterns and dazzling inside lamps has given place to reflected illumination, ensuring the uniform distribution of light and a far more cheerful effect than that obtainable by previously adopted methods.

Each shop window is lined along the front inside the glass with rows of incandescent lamps concealed by metal strip reflectors, the lamps being attached in pairs by twin holders.

The reflectors are suspended by adjustable chains at the height of about 10 ft. above pavement level, and the top of each reflector is enamelled white. A separate wiring-box is provided for each reflector unit, the lamps having the illuminating power of fifty candles, and, being made for the pressure of 100 volts, they are arranged two in series on the 200-volt circuits. The lamps employed for window lighting represent the total of 25,000 candle-power.

Heating and Cooking Apparatus.

The heating and ventilation of the basement was carried out by Messrs. Comyn Ching & Co., Ltd., the method adopted being to blow air into the building at the rate of two million cubic feet per hour through two large electrically-driven fans of the blower type, and to extract vitiated air by means of exhaust type fans.

Fresh air is drawn in through an intake at some height above ground level, and in cold weather passed over steam-heated coils, raising its temperature by 25 deg. Fahr.

After having been warmed the air is conveyed through galvanised steel ducts, some of which are as large as 3 ft. 6 in. by 2 ft. 6 in., to the various discharge openings situated above head level and provided with regulating dampers. Similar ducts are provided for the extraction of vitiated air.

An interesting feature of the air ducts is that wherever passing through division walls they are fitted with automatic fire shutters, arranged so as to close on the melting of a fuse, and thus to obviate the risk of fire being communicated from one part of the building to another by way of the air ducts.

The heating system for the ground floor and upper stories includes an extensive installation of pipes and radiators through which exhaust steam from the engines in the generating station is drawn by means of vacuum pumps fixed in the engine-room.

This part of the heating installation, as well as the hot-water services and gas supplies for cooking purposes, were executed by Messrs. H. J. Cash & Co., Ltd.

The cooking apparatus was supplied by the Briffault Range Company, Ltd.

Vacuum Cleaner Plant.

In accordance with modern ideas, Messrs. Whiteley have abandoned old-fashioned methods of sweeping and dusting in favour of vacuum cleaning apparatus.

The installation, which is of a very complete character, was made by the Vacuum Engineering Company, Ltd., of London, and presents several features of interest.

With the object of permitting a large number of cleaners to be in use at the same time, three powerful vacuum machines have been laid down, each being an "Otavacum" turbine vacuum cleaner of novel design, with the normal capacity of 800 cub. ft. of air per minute and the maximum capacity of 1,800 cub. ft. per minute. The machine includes a 10-horse-power electric motor, to which is connected an air turbine of simple and ingenious construction. A noteworthy feature of the apparatus is its remarkable freedom from vibration.

Air and dust drawn in by the turbine enter a deflector and pass round a curve, where the dust is separated by centrifugal force and falls into a collecting tank, while the air passes away through an exhaust outlet of 18 in. diameter.

The dust collector can readily be removed for emptying purposes by the aid of a lever which lowers a platform supporting the tank, the lever being employed in the reverse direction for raising the platform and fixing the tank in position after it has been emptied.

The main risers are of 4 in. diameter, with the aggregate length of about 1,000 ft. The horizontal pipes are of 5 in. diameter with the aggregate length of 1,200 ft. All the pipes are of mild steel, of specially smooth interior finish, and exceptional care was taken in the design of bends and junctions.

If rectangular T-pieces were used at the junction of the horizontal pipes with the vertical risers the air would undoubtedly pass in the required direction, but a considerable proportion of the dust would be carried forward into the opposite branch and tend to choke the pipe beyond. Moreover, hairpins and other objects which are invariably found in shops frequented by ladies have an awkward habit of lodging themselves across projections in vacuum tubes, where they constitute a fruitful cause of stoppage.

In order to obviate risks of this kind the junctions between the horizontal and vertical pipes in the installation at Messrs. Whiteley's new premises are in the form of curved Y-pieces, having the effect of guiding both air and dust in the required direction.

The unusually large diameter of the pipes employed is another valuable safeguard, and in addition it contributes to the efficient working of the installation.

For the attachment of the hose-pipes to which the dust-removing appliances are fitted the vacuum pipes are provided with 104 inlets, distributed at convenient points on the walls of the building.

Each inlet has a lid that is kept closed when not in use by a spring, as well as by the pressure of exterior air.

To attach a hose-pipe it is simply necessary to lift the lid and insert the end of the hose, the connexion being made air-tight automatically by means of an india-rubber washer. In order to guard against the accidental displacement of the hose-pipe, the lid of the inlet is provided with a projection which engages a circumferential rib at the end of the pipe. The connexion so formed can readily be broken by opening the lid a little wider.

The hose-pipes are of 2 in. internal diameter, and from twelve to twenty-four of them can be used simultaneously. They are supplied with dust-removing fittings suitable for cleaning floors and dusting walls, fixtures, furniture, and objects of various kinds.

Drainage System and Sanitary Work.

The whole of the work coming under this head, as well as the heating and ventilation systems, were carried out under the supervision of Messrs. Corby & Boyce, consulting engineers, of Buckingham-street, W.C.

From the drawings reproduced in our first article (p 697 *et seq.*) it will be gathered that the drainage system in Messrs. Whiteley's premises is one of exceptional magnitude. The provision for dealing with storm water is necessarily on a more extensive scale than that usually necessary in business houses, and a novel feature of the sanitary installation is a complete and independent drainage system in the basement story, for the special purpose of carrying away any water used for fire extinguishing purposes.

All the drains are constructed of extra heavy cast-iron socketed pipes, from 4 in. to 9 in. in diameter, jointed with rope lead so as to obviate the employment of yarn.

At all points where branches join the main drain pipes, and at all changes of direction, specially designed cast-iron junction boxes are fitted, the boxes being enclosed in brick chambers, each with a manhole frame and cover.

Some fifty chambers of the kind have been provided in the building, the underground drains alone comprising more than 3,000-ft. run of piping.

The plumbing also covered a very large amount of work, carried out in a most complete manner, and regardless of cost wherever necessary to ensure perfectly satisfactory results.

The main soil and ventilating pipes in connexion are of extra heavy lead drain piping, the wastes being of galvanised steam tubing with lead joints.

In setting out the sanitary system throughout care was taken to comply with the fire-prevention requirements of the County Council, one stipulation being that no pipe should pass through an area of the interior walls dividing up the building into distinct sections as already described.

The sanitary fittings comprise about 100 closets, ninety lavatory basins, forty urinals, and thirty-five sinks. All these fittings were selected by the architects.

Most of the closets were supplied by Messrs. Doulton & Co., Ltd., of Lambeth. They are enclosed by marble divisions in metal framing with teak doors. The basins are of the "Wandle" and "Axis" patterns, the former with lead trap and pottery liner working perfectly with a 2-gallon flush, and the latter with movable lead outlet bend. Doulton's "Paisley" water-waste preventers are provided, with non-corrosive interior fittings.

The lavatory basins, of white glazed "Victorian" ware, and some of marble, were supplied by Messrs. Shanks & Co., Ltd., of Barrhead.

In addition to urinals, Messrs. John Bolding & Sons, Ltd., of London, supplied ten pillar pattern closets, with water-waste preventers and the necessary fittings.

The cold-water supply system, with large storage tanks on the roof, supplies every part of the premises, and includes numerous washing-down hydrants on the main roof, in the loading yards, and at selected points on the three frontages of the building.

Similar hydrants with sprinklers are provided for cleansing the large domes, a special motor and pump having been laid down for the supply of water at the increased pressure requisite.

The whole of the plumbing work was executed by Messrs. Holloway Bros. (London), Ltd., the general building contractors.

GENERAL NEWS.

Professional and Business Announcements.

Owing to the demolition of the premises, No. 107, Bishopgate, London, E.C., Messrs. Leonard & Clarke, quantity surveyors, are removing their offices to No. 7, Camomile-street, Bishopsgate, E.C.

As the London County Council require the premises, No. 55, Lincoln's Inn-fields, London, W.C., for improvements, Mr. A. J. Bolton, architect and surveyor, after some forty-four years' occupation, has removed to No. 30, Theobald's-road, Bedford-row, W.C.

One of the pupils of Mr. G. P. Knowles, of 39, Victoria-street, Westminster, S.W., heads the list in the recent competitive examination for an appointment in the Valuation Office, Ireland.

The Quantity Surveyors' Association, Incorporated.

Mr. Henry Riley has been elected President of this Association for the ensuing year, and Messrs. T. J. Carless and T. E. Bare Vice-Presidents.

Marylebone Municipal Buildings.

The Borough Council have resolved to borrow, with the sanction of the London County Council, 70,000*l.*, wherewith to proceed with the erection of the new Town Hall in Marylebone-road, south side, at the west corner of Gloucester-place. In our numbers of December 1-8 last we illustrated the four premiated sets of designs. Those by Mr. T. Edwin Cooper, F.R.I.B.A., were placed first in the competition, and were adopted from the 181 designs submitted.

Extension of the Royal Albert Dock.

The Port of London Authority have offered to Messrs. S. Pearson & Son, Ltd., the contract, amounting to about 1,400,000*l.*, for the new dock on the south side of the Royal Albert Dock. The undertaking extends to the making of a main dock 4,500 ft. in length by an average of 600 ft. in width and 35 ft. deep, and having a water area of 65 acres, a dry dock, and an entrance lock 800 ft. by 100 ft., and 45 ft. deep, with a channel lock into Royal Albert Dock.

Presentation to Mr. A. Y. Nutt, M.V.O.

The retirement of Mr. A. Y. Nutt, after forty-four years' service in the Architect's Department and as Resident Architect, Windsor Castle, has been signalised by the gift to him of a silver-mounted dressing-case by the staff of H.M. Office of Works, the Lord Chamberlain's Department, and contractors, workmen, and friends at the Castle.

The Birthday Honours, 1912.

The birthday honours include: Baronetcy—H. L. Tangye, M.I.M.E., of Tangyes, Ltd.; Knighthood—Colonel Prain, F.R.S., Director of the Royal Botanical Gardens, Kew; C. H. Read, P.S.A., Keeper of British and Mediæval Antiquities, British Museum; Dr. C. Waldstein, late Slade Professor, Cambridge University; and W. Wallis, F.S.A., Director Birmingham Art Gallery. K.C.B.—Dr. Kenyon, Director and Principal Librarian, British Museum. C.S.I.—O. C. Lees, M.Inst.C.E., late Chief Engineer and Secretary to the Government of Burma, P.W.D.; and W. E. T. Bennett, M.Inst.C.E., Chief Engineer and Secretary to the Government of the Punjab, P.W.D. K.C.I.E.—Dr. M. A. Stein, C.I.E., Archæological Department, N.W. Frontier Circle. C.I.E.—Major S. D. Crookshank, M.V.O., R.E., Executive Engineer, P.W.D.; D. W. Aikman, P.W.D., Sanitary Engineer, Punjab. C.M.G.—W. J. Downer, I.S.O., Assistant Secretary, H.M.O. Works; and C.I.S.O.—J. Strauchon, Surveyor-General, Land and Survey Department, Dominion of New Zealand.

Mr. E. O. Sachs.

Mr. Edwin O. Sachs, F.R.S.Ed., has been accorded the distinction of a Knight (1st Class) of the Royal Swedish Wasa Order, and the King has granted him permission to wear this decoration, which has been conferred upon him for the services rendered by him in connexion with the design of the Royal Dramatic Theatre at Stockholm.

Cranmer Memorial, Cambridge.

On June 13 was unveiled in the chapel of Jesus College a memorial to Cranmer, who until he became Primate in 1533, was a Fellow of the College. Mr. Albert Bruce-Joy executed the medallion portrait, which is set in a carved alabaster frame, and the likeness is after the picture of 1546 by G. Flicius, in the National Portrait Gallery.

International Road Congress, 1913.

The third International Road Congress will meet on June 23-28 of next year, in London. Arrangements are made for receptions by the Corporation of the City and the First Commissioner of Works on June 23, and by the Institution of Civil Engineers, in either their new premises or the Albert Hall, on June 25, and by the Royal Automobile Club on June 26. Members of the Congress will inspect roads in the Home Counties, visit Windsor Castle, by invitation of the King, and proceed up the River Thames. On June 26 the Chancellor of the Exchequer will deliver the opening address. On June 27 the final meetings will be held and a garden party will be given by the Surveyors' Institution. On June 28 there will be a banquet in the Hotel Cecil.

Tooley-street Tram Extension.

The proceedings before the Select Committee of the House of Commons with reference to the proposal of the London County Council to extend the tramways in Tooley-street, a distance of 300 yds. nearer London Bridge, is an example of the sort of opposition from private vested interests with which all public improvements have to contend. Although the police gave evidence that the proposal would not create any special difficulty in regulating the general traffic, it was opposed by the traders in Tooley-street. Evidence put forward on their behalf showed that there was an average of 900 vehicles a day using the wharves and other business premises in Tooley-street, and it was contended that any extension of the trams would seriously impede this traffic. It is, of course, necessary and right that all such points should be raised and be given their due weight, but if such arguments are allowed to prevail it is difficult to see how any improvements could be carried out. We are glad to see that the Committee passed the proposals and allowed the extension.

Geological Survey.

It is notified in the report of this department for the year 1911 that in England and Wales the field-work has been carried on in three districts—the Denbighshire district, the Warwickshire district, and the London and South-Eastern district. In the latter, the well-known subdivisions of the chalk and overlying tertiary strata are being traced in detail, together with the various gravels, sands, loams, and brick earth which constitute the superficial deposits. While the mapping of the chalk has an important bearing on questions of deep-seated water supply, that of the tertiary and superficial deposits has a more special importance in all questions connected with the subsoil, such as its suitability for residential, horticultural, sanitary, and other purposes, apart from the economic uses to which the gravels, sands, and brick earth are put. Here also scientific problems of much interest come up for consideration, such as the age and origin of the high-level gravels and loams and their connexion with the glacial deposits of other regions, and the relation of the river terraces and other valley deposits to the various stages of palæolithic time, which have been recognised on the Continent.

COMPETITION NEWS.

A list of current Competitions is printed on page 740.

Mural Decorations, Crosby Hall.

The Committee of the Exhibition of Designs for Mural Painting and for the Decoration of Schools, etc., which is being held at Crosby Hall, Chelsea, announce the following results of competitions:—

Gallery of Modern Art, Dublin.—Awards have been made to Mr. Walter Bayes, Mr. F. Cayley Robinson, Mr. James Mark Willcox. (Sir Hugh Lane offered 100*l.* each for the execution of three panels from designs to be approved by him.)

Middlesex Hospital.—A prize of 50*l.* is awarded to Mr. Donald MacLaren. (Mr. Edmund Davis offered 100*l.* "In the event of a design being accepted and not approved of by the Middlesex Hospital, the sum of 50*l.* will be given in lieu of the execution of the work.")

Commercial-street L.C.C. School.—Miss Louise Jacobs. (A sum of 25*l.* was offered for the execution of an approved design.)

Cable-street L.C.C. School.—Mr. Stanley H. North. (A sum of 25*l.* was offered for the execution of an approved design.)

Design for School Banners.—Miss Gwynedd M. Hudson, Miss Eleanor Pallett, divided. (10*l.* was offered.)

The results of other competitions will be announced shortly. The exhibition will remain open until June 29.

Liverpool School of Town Planning.

In competition for prizes amounting to 50*l.*, offered by Sir William Lever, an area was selected to be reconstructed on monumental town-planning lines. The site chosen was the triangular area between Mount Pleasant and Brownlow-hill. The first part of the award has been decided, namely, first prize (15*l.*) to Mr. R. H. Mattocks, second prize (10*l.*) to Mr. T. W. Hooley. These designs, with others, are illustrated in the current *Town Planning Review*.

Astley Bridge, Bolton.

Mr. John Bennett, Lic.R.I.B.A., of Bolton, was the assessor in the competition for Parochial Hall, Men and Women's Institute, Gymnasium, etc., and the following results have been announced:—First, Messrs. Marshall, Robinson, Son, & Wheeler; second, Messrs. Henderson & Brown; third, Mr. Frank Freeman.

The R.I.B.A.: The Soane Medallion.

The attention of intending competitors for the Soane Medallion is called to the following modifications in the conditions:—

1. No restriction is placed on the size of the strainers, but they should be of reasonable size.

2. The plans, sections, and elevations to be drawn to one-sixteenth scale.

3. A section through the front buildings up to and including the rail heads of the lines to be drawn to a scale of 8 ft. to an inch.

4. Plans of the upper floors and basement need not be drawn.

A.A. Competitions, 1912.

The following list of awards has been published officially:—

A.A. Silver Medal and prize value ten guineas, to Mr. R. M. Pigott.

A.A. Travelling Studentship, not awarded.

Ditto, second prize, value 5*l.*, to Mr. B. W. Ridley.

Banister Fletcher Bursary, value twenty-five guineas, to Mr. V. O. Rees.

Architectural Union Company's prize, value 20*l.*, to Mr. W. J. Palmer-Jones.

Herbert Batsford prize, for the best drawing in the Sketch-Book for 1911, value five guineas, to Mr. W. S. George.

Essay prize, award not yet made.

Church of St. George, Colwyn Bay.

Mr. Leonard W. Barnard, of Messrs. Prothero, Phillott, & Barnard, Cheltenham, has been awarded first place in a limited competition for the new church of St. George, to be erected at Colwyn Bay.

Regent's Quadrant Competition.

Competitive drawings must be delivered at the office of the *Builder*, 4, Catherine-street, Strand, on or before 5 p.m. on Friday, June 28. An anonymous competitor, who is sitting for the R.I.B.A. Final Examination, asks if the date can be again advanced, but we regret that this cannot be arranged.

Proposed Baths at Balham.

The Baths Committee of Wandsworth Borough Council have had under consideration the conditions of the competition for the designs for baths they propose to erect at Balham, and are of opinion that competitive designs should be invited and that an assessor should be appointed.

BOOKS.

The Early Norman Castles of the British Isles. By ELLA S. ARMITAGE. (London: John Murray. 1912.)

FOR at least a generation the student of the remains of English castles has had to be content with the collection of papers by the late Mr. G. T. Clark, originally printed in the *Archæological Journal*, the *Builder*, and elsewhere, and published by him as a separate work in two volumes in 1884, under the title of "Mediæval Military Architecture in England."

As Mr. Clark's contributions to the subject extend over some forty-five years they naturally vary in quality, and his published collection, which was in no way revised, is marred by a number of contradictions and other blemishes. Notwithstanding, it is still the only work that treats of castles in general both from the documentary and the architectural standpoints, and until a like work is undertaken on a larger and more extended scale it is not likely to be superseded.

Mrs. Armitage's book is not an attempt to go beyond Mr. Clark's work, but is principally concerned with the refutation of a particular theory which was enunciated by him, that the moated mounts which form the dominant feature of so many English castles are identical with the "burhs" mentioned in the Anglo-Saxon Chronicle, especially in connexion with the operations of Edward the Elder and his sister Ethelfleda, the Lady of the Mercians.

The "burh" theory was first challenged by Mr. J. H. Round in the *Quarterly Review* for July, 1894, and further discussed by Mr. G. Neilson in the *Scottish Review* for October, 1898, with reference to the moated mounts found in Scotland. But the question was first dealt with more fully about a year and half later by Mrs. Armitage in a paper communicated to the Society of Antiquaries of Scotland on "Anglo-Saxon Burhs and Early Norman Castles." In this paper the writer contends that the word "burh" or "burgh" connotes a fortified town and not a moated mount, and that the latter are not of Saxon date at all, but the site of Norman castles. Mrs. Armitage subsequently expanded her views, with special reference to the castles mentioned in the Domesday Survey, in the *English Historical Review* for April and July, 1904, in two communications on "The Early Norman Castles of England," and these papers, with her former treatise, form the basis of the larger work which she has now published.

So far as English castles are concerned, Mrs. Armitage's views have been accepted by all serious students, and the documentary evidence for them was marshalled at length in a paper on "English Fortresses and Castles of the Xth and XIth Centuries," read before the Royal Archæological Institute in 1902, and printed in the *Archæological Journal*, LX., 72–95, by Mr. W. H. St. John Hope, who emphasised the important point that the general distribution of moated-mount castles throughout England could not have been brought about by any one dominant power other than the Norman. It is somewhat strange that Mrs. Armitage should practically ignore Mr. Hope's contribution to the controversy.

The application of the Norman castle theory to the parts of Scotland that were under Norman influence has also been accepted by the Scottish antiquaries, but its reference to Ireland has met with considerable opposition in some quarters from writers who have evidently not grasped the elements of the question. The historical evidence has, however, now been reviewed by Mr. G. H. Orpen, who has demonstrated quite clearly the Norman origin of similar works in certain parts of Ireland.

Mrs. Armitage's book concerns itself with Anglo-Saxon and Danish fortifications, the origin of private castles, the distribution and characteristics of motte-castles (as she prefers to call them), the castles of the Normans in England, motte-castles in North Wales, and in South Wales, and in Scotland and in Ireland, together with remarks on stone castles of the Norman period.

This last chapter is the one that should most appeal to those concerned with buildings; but, unhappily, it is the weakest in what is otherwise an interesting book. It begins with the usual confusion between keeps and castles, which later on leads to the statement that "no stone castles in England are known to have been built by William Rufus"; yet on a previous page (p. 197) we read: "It is well known that between the years 1087 and 1089 the celebrated architect, Gundulf, Bishop of Rochester, built a new *stone* castle for William Rufus." The existing keep of Rochester Castle is also stated to be "the only one in England which authentic history gives" to the time of Henry I., though elsewhere (p. 205, note 3) reference is made to the mention "in the solitary 'Pipe Roll' of Henry I." (for 1130–1) of the tower of keep of Salisbury Castle (*turris Sarum*). The fine tower of Hedingham Castle, which apparently is unknown to Mrs. Armitage (although Mr. Montgomerie has given her a plan of its earthworks), is allowed by most authorities to have been planned by the same engineer as William of Corbeuil's great tower at Rochester, and a similar remark as to their joint planning applies to the keeps of Castle Rising and Norwich, the latter of which, with that of Corfe, Mrs. Armitage thinks may have been built by Henry I. Ludlow, a castle apparently unknown to Mrs. Armitage, could have furnished her with another and a remarkable early example of what she calls a "gatehouse keep," as could the Nottinghamshire castle of Newark. On p. 366 a list is given of "the keeps which the 'Pipe Rolls' show to have been built or finished by Henry II." It begins with Scarborough (1157–74) and ends with Tickhill (1178–81), which is referred to again two pages on as "the last keep he built." The list should, however, have ended with Dover, on which Mrs. Armitage elsewhere tells us (p. 142) that "the 'Pipe Rolls' show that he [Henry II.] spent more than 2,000*l.* on the *turris* or keep of Dover Castle between the years 1181 and 1187."

The book concludes with a number of appendices; also with a very defective index. For example, not one reference to the names in the list of keeps on p. 366 is given, nor does it include Bungay, Burton, Conisborough, Derby, Northampton, Ongar, and Yalden, which are a few of the places not indexed that we have noted in the book. Mrs. Armitage does not seem to have made any reference to four such important castles as Framlingham, Hedingham, Ludlow, or Clare, but haply they have only escaped inclusion in her insufficient index.

The book has been printed by Mr. Murray, which accounts for its excellent typography, and is illustrated by an admirable series of comparative plans by Mr. D. H. Montgomerie.

Stresses and Strains. By F. R. FARROW, F.R.I.B.A. Second Edition, revised. (London: Whittaker & Co. 1912. Pp. 138. 5*s.* net.)

HAVING reviewed the first edition of this useful manual shortly after its appearance in 1900, it is unnecessary to deal at length with the present issue. Various modifications have been made in the text with the effect of making definitions and explanations still more clear to the student. The calculated examples have been checked throughout, and these have been inserted in the chapters dealing with the branches of the subject to which they refer, instead of being relegated to an Appendix as before. This is a decided improvement, and will make the book much more convenient to students and others.

Concrete Costs. By FREDERICK W. TAYLOR, M.E., Sc.D., and SANFORD E. THOMPSON, S.B., M.Am.Soc.C.E. (New York: John Wiley & Sons. London: Chapman & Hall, Ltd. 1912. Pp. 692.)

THERE is a great deal more in this book than the title denotes. The authors give much valuable practical information concerning the proportioning of concrete, preparing aggregates, handling and transporting materials, mixing concrete, by hand and by machinery, the design of moulds and centring, and other technical matters. The numerous tables of cost relating to the execution of work in plain and reinforced concrete are exceedingly valuable, despite the fact that they are based upon American prices of materials and rates of labour. However, the data are given in such full detail that it is not a difficult matter to arrive at the equivalent costs applying to similar work in this country. The importance of this manual to contractors cannot be over-estimated, and its value to architects and engineers is equally obvious. The book is one which we are able to recommend strongly to the attention of our readers.

FIFTY YEARS AGO.

From the *Builder* of June 21, 1862.

Something to be Done.

WHILE bad drainage, over-crowding, the ill-construction, want of ventilation, and other defects of the dwellings in our large towns certainly cause a multitude of deaths which might be prevented, we must not overlook other causes of evil. We should attend with care to the proper drainage, ventilation, space, etc., of the schools, not only of the poorer classes, but also of those provided for the children of persons in better circumstances. There are great improvements to be made in these arrangements.

Although we have good reason for congratulation that the exertions which have been used have nearly prevented the system of intramural interments in the metropolis, there are still pernicious effects from keeping the dead for a considerable time in dwellings, particularly of the poorer classes; and from the practice which also exists of keeping dead bodies brought from the hospitals and workhouses, and those of people drowned. There are other things which call loudly for remedy, particularly the better supply of water daily to the poor. Taking encouragement from the past, and hoping that the success which has attended recent efforts will lead to greater exertions, we trust that by the time another great international exhibition happen we may be able to make, not only as regards the metropolis, but throughout the country, satisfactory note of sanitary progress.

EDITORIAL SUMMARY.

The leading article is entitled "The Architect in Utopia."

In Notes columns (p. 716) will be found observations on: "Manchester Old Town Hall"; "The University of South Africa"; "The Advertisements Regulation Act."

Notes on some Picture Exhibitions appear on p. 717.

A short article on "Temporary Exhibition Buildings" is given on p. 718.

A summer visit of the Architectural Association was made to Hitchin on Saturday last, a notice of which appears on p. 718.

An article on Messrs. Whiteley's New Premises in Queen's-road, W., is given on p. 719.

In Book Reviews (p. 723) are notices of "The Early Norman Castles of the British Isles"; "Stresses and Strains"; and "Concrete Costs."

The Illustrated Monthly Historical Review (p. 727) includes: "The Altare della Patria"; "The Architecture of Portugal"; "Egyptian Exploration," etc.

The Building Trade Section (p. 732) contains: "Co-partnership and Labour Unrest"; "Concrete-Mixers"; "Building Act Anomalies"; "Institute of Certified Carpenters"; etc.

A concluding article on the Adelphi Hotel, Liverpool, appears on p. 736.

A meeting of those interested in Mural Decorations was held at Crosby Hall, Chelsea, on Tuesday. An interesting discussion took place on Mural Decorations. A report appears on p. 739.

MEETINGS.

SATURDAY, JUNE 22.

The Institute of Sanitary Engineers.—Sessional meeting at the International Exhibition of Non-Ferrous Metals, Royal Agricultural Hall, Islington, N. Professor E. G. Coker, M.A., D.Sc., M.I.Mech.E., will deliver a lecture in the lecture hall on "Lines of Stress in Metals." Illustrated by photographs in natural colours of bodies under stress. 4 p.m.

MONDAY, JUNE 24.

The Royal Institute of British Architects.—(1) To present the Royal Gold Medal for the promotion of architecture, conferred by his Majesty the King, to Mr. Basil Champneys, for his executed works as an architect. (2) To unveil and formally present to the Institute the portrait of the President, Mr Leonard Stokes, painted by Mr. William Orpen, A.R.A. 8.30 p.m.

TUESDAY, JUNE 25.

The Society for the Promotion of Hellenic Studies.—Annual general meeting. The President, Sir Arthur Evans, F.R.S., D.Litt., LL.D., will take the chair and deliver his inaugural address. Burlington House. 5 p.m.

THURSDAY, JUNE 27.

The London Society. Debate on Mr. Raffles Davison's paper on "London as It Is, and as It Might Be." Royal Society of Arts, John-street, Adelphi. 8.30 p.m.

CORRESPONDENCE.

Timber Specifications.

SIR,—I should like, with your permission, to say a few words on the correspondence in your valuable paper re above.

First, as regards the specification given in your issue of the 7th inst., this is almost word for word taken from a recent book written by a practical timber merchant on the subject, and, unless your correspondent is the author of the said book, surely he should have acknowledged the source of the information.

The specification itself is a very good one from many points of view, but I consider it has the following objections:—In the first clauses "sizes 12 in. by 4 in. and under, etc." 3 in. by 9 in. is a much better limit, seeing that 4 in. by 12 in. is the largest imported sawn size in deal, and, consequently, being the widest plank converted from the tree, is likely to contain more sapwood. I have found 4 in. by 9 in. proportionately more free in this respect than 4 in. by 12 in., 4 in. by 11 in., or 4 in. by 10 in., but, all things considered, result in favour of 3 in. by 9 in. as the largest; then, again, we do not get many 4 in. by 12 in. from the White Sea; again, the first clause does not define any market quality whatever for sizes 12 in. by 4 in. and under; also White Sea goods of the better qualities are more adapted for joinery than for carcassing. There are several objections to White Sea larch as a general constructional timber, so that if that is specified there would have to be further limitations incorporated.

Fifth clause:—No market quality is here given for the Canadian yellow pine, nor for the American whitewood—and generally the specification would not be reasonable for all classes of work, for the best procurable joinery deal is not required for every job.

My own procedure, which I have successfully followed for the last sixteen years, is to specify the actual manufacturer and trade quality of every material throughout a building, except in such materials where a definite trade quality is equal in all respects among all manufacturers, then I specify such quality, or in those where a source is quite definite, in which last I specify the source, in all cases leaving the contractor free to obtain the goods from whatever merchant he pleases; but on no account whatever should I specify the merchant.

In timber and some other goods I qualify the specifying, for certain reasons, by giving several alternative manufacturers of equal repute. I consider the foregoing procedure must be the proper businesslike way of specifying; as, an instance, the timber importer knows perfectly well what manufacture and market quality he is buying, and only pays for that, so why should not anyone acting for a building owner specify what manufacture and trade or market quality he desires, and see that he gets it? The builder then would only be expected to keep to a definite and obtainable article. We do not get the latitude and indefiniteness common to building works in specifications connected with other industries, nor yet in the wholesale trades from which building materials emanate, and any departure from the absolute definition, if not rectified or a monetary allowance made, soon finds its way into the Courts. Of course, it may be said that if actual manufacturers and qualities are specified it is not everyone who specifies that can differentiate the goods; but I venture to suggest that is one of the original responsibilities of the specification-writer, either personally or through specialist assistance; at least, it is so in business concerns—*e.g.*, an iron merchant or a glass merchant makes a contract for a definite manufacture and quality of material, and examines it when delivered to verify its correctness.

A very potent reason for specifying actual manufacturers and trade designations is that we must use what is obtainable, taking care that it is specified of the right quality and for the specific purpose; it is of no use specifying general perfections which cannot be obtained in natural products, and if such perfections are desired they must be sought in a different material. I give hereafter some of my own specification clauses for building timbers, chiefly for best-class work, which are based on many years' experience, involving special training with all parties interested; they are part of those I have been using for fifteen or sixteen years, but brought up to date. The shippers are specially selected as being those who use great care in bracking their goods, and who send reasonably large quantities to this market. I could give others equally as good, but it is obviously impracticable to specify many alternative manufacturers and the stocks available, and their immediate condi tions would guide me personally as to who I should include.

Carpenter.—The whole of the wood to be perfectly sound, clean, and bright, dry, free from blue sap, and loose, dead, or decayed knots.

The deals, battens, scantlings, and thicknesses for carcassing to be either of the following:—Shippers' second quality "Gefle" Red, of "Stora Kopparbergs Bergslags Aktiebolag's" shipment, or shippers' second quality "Söderhamn" Red, of "Bergvik och Ala Nya Aktiebolag's" shipment. Sizes of carcassing timber under 3 in. by 6 in. to be home-sawn out of wider imported dimensions. The boarding to flats, gutters, and valleys may be imported sawn "Kemi," of "Travarn Aktiebolaget Kemi's" shipment, and the rough fillets may also be sawn from these. All timbers more than 9 in. deep, or more than 3 in. thick before they are planed, are to be either of the following:—Shippers' prime quality pitch-pine, of "Hunter, Benn, & Co.'s" shipment, "Southern States Lumber Company's" shipment, or "Rix M. Robinson's" shipment; shippers' select quality British Columbian or Oregon pine, of "The British Columbia Mills Timber and Trading Company's Hastings Saw Mills'" shipment, "Stanley Barker Lumber Company's" shipment, or "Portland Lumber Company's" shipment, or converted by the contractor from these, and all to be sawn square-edged or die square, as the case may be, and all thoroughly open-air seasoned.

Joiner.—The whole of the deal joiners' wood to be perfectly sound and thoroughly open-air seasoned, free from coloured sap, large, loose, dead, or decayed knots and shakes, and to have been sawn into thicknesses and stacked and skidded in open-air drying sheds for at least one year before being brought to the bench, and then selected to suit its individual purpose.

The external deal joiners' work is to be executed with either shippers' first quality "Björneborg" Red, of "W. Rosenlew & Co.'s" shipment, or shippers' first quality "St. Petersburg" Red, of "Oscar Steveni's" shipment. The internal deal joiners' work is to be executed with either shippers' first quality "Kovda" Red, of "N. Russanoff Sons'" shipment, or shippers' first quality "Archangel" Red, of "Surkow & Shergold's" shipment. All boards to be home-converted from not larger deals than 3 in. by 9 in., and any sizes under 3 in. by 7 in. to be home-converted from larger imported sizes not exceeding 9 in. wide.

The deal floorboards to be one of the following:—Shippers' extra first quality "Yunds vall" Red, of either "Skonviks' Aktiebolag" shipment, or "Wifsta Warps Aktiebolag" shipment; shippers' extra first quality "Gefle" Red, of "Korsnäs Sågverks Aktiebolag" shipment, or shippers' first quality "Umeå" or "Örnsköldsviks" Red, of "Mo and Domsjö Aktiebolag" shipment, all to be thoroughly dry and thoroughly well open-air seasoned before being used in the work. The Canadian yellow pine to be shippers' first quality Quebec or Montreal broad pine of either of the following shipments:—"Cox, Long, & Co." "J. Burstall & Co." "W. & J. Sharples," or "Dobell, Beckett, & Co."; to be stacked and skidded for not less than one year before being used for the work, thoroughly dry and sound, clean, and selected free from stains, shakes, sap, loose or dead knots, and other defects.

The American whitewood to be shippers' prime quality of either of the following shipments:—"T. J. Asher & Sons." "Ritter Lumber Company," or "G. M. Spiegle & Co.," to be stacked and skidded for not less than one year before being used for the work, thoroughly dry and sound, and selected clean and free from shakes, loose or dead knots, and other defects.

All hardwoods generally to be specially selected to suit their respective purposes and free from shakes and knots.

The English oak to be from well-grown, straight-grained, winter-rased trees of not less than 5 ft. diameter, which have been felled not less than six years, to be open-air seasoned in the log for two years, and then sawn up into boards and planks, and stacked and skidded in open-air drying sheds for a further period of not less than four years, thoroughly dry and sound, and cut out free from sap, pith, knots, and shakes, and out of winding.

The oak for sash-frame and casement-frame sills to be either "Odessa" oak, of "J. H. Meyersohn & Co.'s" shipment, or "Danzig" or "Riga" oak of "Julius Potempa's" shipment, cut up into planks and stacked and skidded in open-air drying sheds for at least two years before being used for the work, thoroughly dry and sound, and cut out free from sap, pith, stains, loose or dead knots, and shakes, and out of winding.

The Austro-Hungarian wainscot oak to be either of the following shipments:—"Nasie Oak Extract Factory and Steam Saw Mills Company, Ltd." "Eissler & Brüder." "Société de Importation de Chêne." "S. Priday," or "Oliver & Sons."

The Russian wainscot oak to be either "Riga," of "B. S. Kahn's" or "Melzer & Co.'s" shipment, or "Liban," of "Blumstein & Rosowsky's" shipment.

All wainscot oak to have been sawn up and stacked and skidded in open-air drying sheds for not less than four years before being used for the work, thoroughly dry and sound, cut wainscot, selected for figure and colour, and free from sap, stains, shakes, knots, or other defects.

The teak to be shippers' prime Moulmein of either of the following shipments:—"Bombay, Burmah, Trading Corporation, Ltd." "Steel Brothers & Co., Ltd." or "F. Foucar & Co., Ltd." All to be cut out of plank into thicknesses, and stacked and skidded in open-air drying sheds for not less than four years before being used for the work, thoroughly dry and sound, and selected for colour, and free from stains, shakes, grub, burrows, or other defects.

I have refrained from giving specifications for the mahoganies, walnuts, and other woods, both foreign and British, as I am afraid I have already taken up too much of your space: but I may say that I follow out the same methods, not only for woods, but for every material used in building, as I was early convinced that there was no other proper way

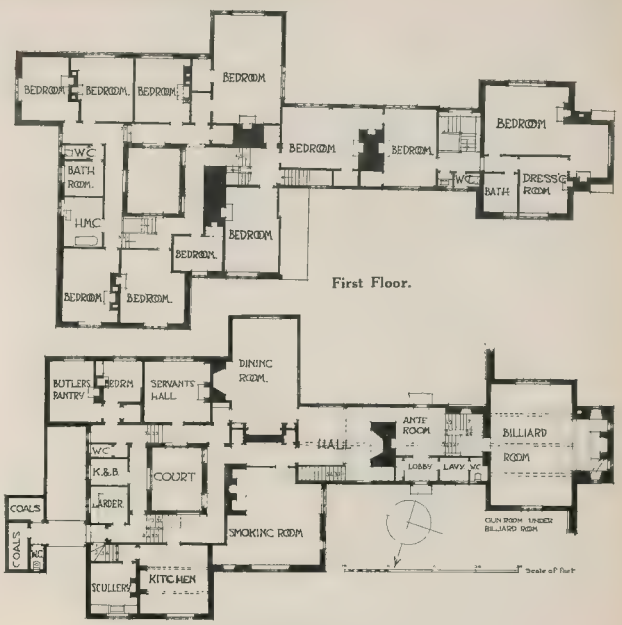
of specifying and discrimination for measuring and valuing; but it necessarily involves commencing to take separate specialist trainings at a very young age, in order to be able by middle life to know what to specify and to see that they are supplied.

B. E. LAINE-PEARSON,
Quality, Quantity, and Value Surveyor.

*** Our original correspondent, "A Reader," states that he is very much indebted to Mr. J. Davis (with whom he has been in communication on the subject), the writer of the book, "Building Timbers and Architects' Specifications"; but the suggested specification is not exactly in the form given in the book. We hope that the correspondence now going on will result in some form of specification which will be generally approved.—ED.]

INTERCOMMUNICATION COLUMN.

Paper for Rubbings.



SIR,—Will you be so kind as to inform me what kind of paper is right to use for taking "rubbings" (*i.e.*, "heel ball") from monumental brasses, especially the heraldic coats? Will ordinary white "kitchen-paper" do?

EVA LETHBRIDGE.

Reply.

SIR,—I have never tried kitchen-paper, but do not think it would be as satisfactory as ordinary ceiling or lining paper, which can be procured from any paperhanger. There are two qualities:—(1) At 6d., which is thin, and perhaps gives slightly the clearer impression, but is rather apt to tear; (2) cost 8d., is thicker, and so less likely to tear. The rolls have about 12 yds. in them. I have always found either of these qualities very satisfactory, but generally use the thicker for large brasses. For shields, I consider the cheaper is perhaps slightly better, but it is rather a matter of personal taste. If the rubbings are to be cut out and mounted on linen, the thinner is certainly the best. Your correspondent does not ask any questions *re* the heel-ball, but this is more important than the paper. It should give a very black mark when rubbed on paper, and should not be too hard, nor should it be sticky. Much of the heel-ball offered is too brown to give satisfactory results. It is well to melt down several of the small pieces in which one buys it, to form a large lump, which can be held in the palm of the hand.

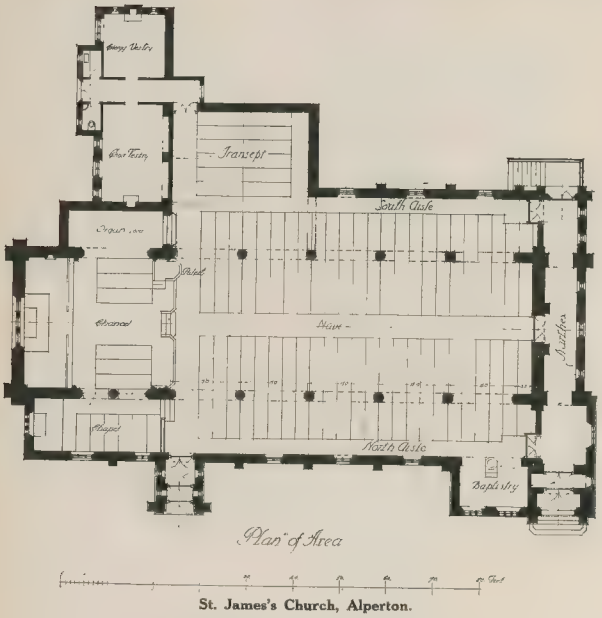
J. S. M. WARD.

"Oldcastle," Dallington, Sussex: Ground Floor.
Mr. Ernest Newton, A.R.A., Architect.

ILLUSTRATIONS.

Victor Emmanuel Monument, Rome.

IN our issue of January 5 we illustrated the work of Signor Angiolo Zanelli, who was successful in the competition for executing the Altare della Patria on the Victor Emmanuel Monument at Rome. The design of the other sculptor in the final competition, that of Signor Dazzi, is shown on one of our plates and an article on the artist appears on p. 727.



"Oldcastle," Dallington, Sussex.

THIS estate is now the property of Lord Justice Buckley.

The house was a small farmhouse in very bad repair. Previous alterations had swept away

"Oldcastle," Dallington, Sussex.

St. James's Church, Alperton.

Mr. W. A. Pite, F.R.I.B.A., Architect.

everything of interest except some old chimneys. The old part is in the middle, and pieces have been added at each end. The small drawing shows this. The larger drawing is of the new billiard-room wing. The stone wall on the right of this view, according to local tradition, is all that remains of an ancient castle.

The whole of the building work, including stables, garage, kitchen-garden, walls, cottage, etc., was carried out by Messrs. Lower & Piper, of Punnetts Town. All the glazing and the hot and cold supplies were executed by Messrs. Wenham & Waters, of Croydon. The electric plant was installed by Mr. Stanhope Thornton, of Sanctuary House, Westminster. The drainage and sewage disposal was carried out by the Banner Sanitation Company, of Craven-street, Strand.

Mr. W. Nicholls was architect in charge, and personally superintended the carrying out of all the work.

The architect was Mr. Ernest Newton, A.R.A., of Raymond-buildings, Gray's Inn, London.

The drawings are shown at the present Royal Academy Exhibition, and in referring to them in our issue of May 10 we wrote:—"The quality of Mr. Ernest Newton's work can hardly be grasped for the exceeding cleverness of his draughtsman. A house, which on one small drawing shows low and long, is shown in part on another large one, looking high and almost heroic. . . ." Mr. Newton sent us the following interesting comment:—"Your criticism of the R.A. drawings of 'Oldcastle,' Dallington, suggests that the draughtsman has taken libertics with his subject. It is quite true, as you say, that one view shows a long low house, and the other a high building. Both these drawings have been made from the actual working details and from photographs of the building. I make a point of this, as I always feel that drawings of architecture should show the building as accurately as possible, and this can only be done when the building is actually built. It is impossible to find time to make perspective drawings oneself, nor, with the limited practice that one gets, would such drawings do as much justice to the building as a drawing made by a man who is always in practice. But, seeing the danger of draughtsmen's work, I have always made it a point only to illustrate those buildings which are actually built; and the draughtsman works from detail drawings and from photographs. The suggestion I objected to in the criticism was that the draughtsman had made more or less imaginary sketches."

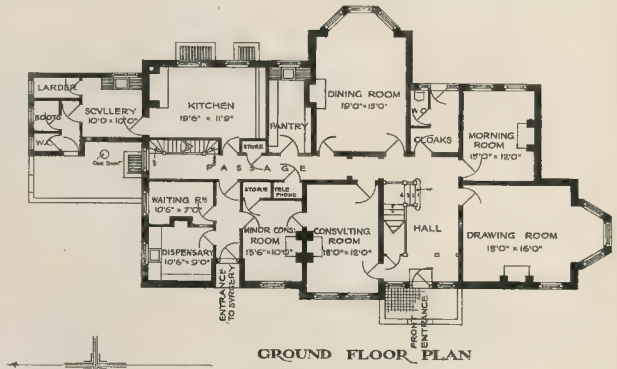
St. James's Church, Alperton.

THIS church, planned to seat 750 persons, is placed upon rising ground, and the view is from the south-west.

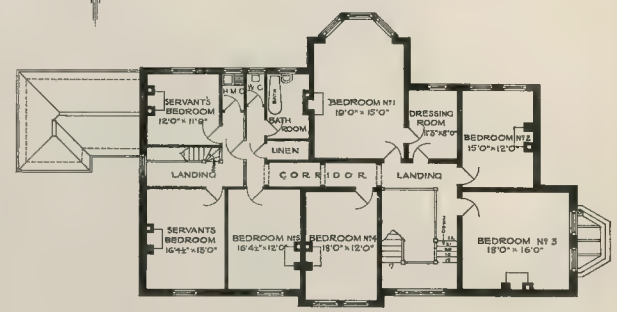
The external materials are picked brown stock with Bracknell brick dressing and Casterton stone.

The roofs are of horseshoe tiles, with a slightly broken colour; these were supplied and laid by Messrs. Ames & Hunter, and possess interesting characteristics.

Internally the building is plastered, the nave arcade being of Farleigh Down stone; the roof, of unstained timber, runs the entire length of the church without any chancel arch. The acoustic qualities of the church are said to be exceptionally good in quality.



The contract amounted to about 7,800*l*. The contractors were Messrs. Foster & Dicksee, Ltd., and the architect was Mr. William A. Pite, F.R.I.B.A.



House at Ashstead, Surrey.

THIS house, which is shortly to be erected from designs by Mr. A. C. M. Edwards, A.R.I.B.A., stands on a prominent site at the corner of Ottways-lane and the main Dorking-road at the end of the village. It is proposed to use a red brick of varied tints with a dark hand-made sand-faced tile for the roof. The house is designed on simple Georgian lines with a view to getting a good effect with the least possible cost. The planning was largely influenced by the necessary requirements of the client's profession, and the surgery and waiting-rooms are designed for easy access and for convenience in communication.

KIRKWALL CATHEDRAL.

The working plans for the restoration of this cathedral of St. Magnus have been prepared by Mr. G. Mackie Watson, architect, of Edinburgh, and the Thoms trustees are inviting tenders for the various works concerned.

House at Ashstead, Surrey.

MONTHLY HISTORICAL REVIEW.

Design for the "Altare della Patria."
By Signor Arturo Dazzi.

THE "ALTARE DELLA PATRIA" OF THE VICTOR EMMANUEL MONUMENT AT ROME:

II.—THE MONUMENTAL ART OF ARTURO DAZZI.

IN the *Builder* of January 5 of the present year we had occasion to describe and illustrate in detail the noble reliefs with which Angiolo Zanelli is now adorning the front of the "*Altare della Patria*," which forms the base of the central figure of Victor Emmanuel in his monument at Rome; and in so doing, while giving full view to the magnificent qualities of Zanelli's art, we did not omit to add our appreciation of the merits of the design which was sent in by Signor Dazzi, noting in this connexion that the Royal Commission, when accepting definitely the design of his rival, had recommended to the Ministry that Dazzi's work should not be entirely destroyed. It is now, therefore, a specially grateful task to complete our notice of the reliefs of the "Monumento" by the fuller account, which we then promised to our readers, of Arturo Dazzi's art; and while treating of this generally we shall keep specially in view his fine design for this altar of the "Monumento." Arturo Dazzi was only eleven years old when (in 1892) he entered upon his art studies; and thus, like his successful rival, whom we noted to have been born in 1879, he belongs to the younger generation of Italian sculptors. We have expressed very strongly, in a preceding article, our opinion of the advantages of such an entirely open competition for great national monuments as that which enabled these two brilliant young men—in both cases little more than thirty years of age—to bring their merits before the public of Italy; and we shall not here dwell further upon that point, but proceed to sketch out briefly the main features of Dazzi's earlier career.

As in the case of Zanelli, so here, too, an early provincial success, the triennial competition of the Academy of Fine Arts at Carrara, which he won with his relief of Andrea Pisano at the quarry of Carrara, gave him the opportunity for completing his studies; and he came to Rome, where two months later he won the Albacini national competition, and soon after the "*Concorso Stanzani*"; he married at this time, and a year after his marriage won the "*Pensionato Nazionale*." Now was the moment for a work which should set the seal on this really brilliant series of earlier successes; and, in fact, in his "Toilers of the Apuan Alps," exhibited at Rome in 1905, although the influence of the Belgian sculptor Meunier may be markedly traced, there is originality in the conception, and merit in the by no means easy treatment of the groups of struggling workers beneath this impassive figure of the "Maiden of the Mountain." The year following (1906) saw in the exhibition of Milan his group (a tragedy of modern life), "At the Hospital Door"; while in the group of "The Builders" (*I Costruttori*), which followed this, and which won for him the medal of Rome and the gold medal of the Munich Exhibition, he treats again the male form in muscular movement with the fullest sentiment of realism.

Signor Arturo Dazzi.

He was now in the last year of his *pension*, and a really fine decorative statue—which was destined to adorn the new Palace of Justice in Rome—that of the Cardinal De Luca, claims our entire admiration. We cannot insist too strongly on the advantage to art of having the best sculptors of their time—and we might here instance Mr. Daniel Chester French in America—to devote their interest to decorative sculpture, which, in its connexion with architecture, affords the highest scope to plastic art; and here in this fine upright figure of the Cardinal, in the XVIIth-century costume, firmly planted on his feet, and with a book of religion held in his nervous right hand, we find a freedom and force of modelling which were worthy of the great Bernini himself.

Let us pass on from this figure to an absolutely different theme, in the classic relief which Arturo Dazzi, after a brief visit to the mountains, commenced to work upon, as his contribution to the decoration of the great altar of the "Monumento"; let us analyse its treatment, its weaknesses, and its success. Both reliefs, we wrote in our previous notice, when speaking of this work as well as that of Zanelli, have this much of subject and treatment in common, that they represent an advancing and ordered group of processional figures, treated in the highest spirit of classic art, and centring in the upright or seated figure of Rome, the "*dea Roma*," the embodied personification of the

"Dea Roma": Design for the Central Figure on the "Altare della Patria."

By Signor Arturo Dazzi.

immortal past as well as the living present and future of the Eternal City.

But where Zanelli's figures possess a certain classic repose, almost realising for us those exquisite lines of the immortal ode of Keats—

"Who are these coming to the sacrifice?
To what green altar, O mysterious priest,
Lead'st thou that heifer lowing at the skies,
And all her silken flanks with garlands drest?"

—these groups within Dazzi's relief seem tormented with a feverish and frenetic energy, and in some cases are almost tumbling over each other in their hurry to arrive at the journey's end. (See Plate.)

What is that end? It is the colossal figure of Rome, enthroned, with the spear clasped in her right hand and a Victory poised on her left, whose sublime repose contrasts (perhaps intentionally) with the tormented multitude which from either side is hurrying towards her. One is inclined to suggest, why all this desperate haste? For the seated figure shows certainly no intention of moving; and, in fact, one may compare the fundamental idea with that of the "Workmen of the Alps," in that both intentionally contrast the thronging busy crowd of human ants with the serene immobility of an elemental form.

For this "*dea Roma*"—this Rome of

Dazzi—is almost elemental, superhuman; the mere contrast of her colossal size lifts her far away from the crowd of humans, while the traditional wolf at her feet is reduced proportionately to the dimensions of a lap-dog.

One cannot help feeling that there might have been another treatment of the subject which would have been closer to the spirit of Rome than either the Hellenic serenity of Zanelli's relief or the frenzied crowd of his competitor. The Roman Triumph which was designed for the Gonzaga Lords of Mantua by their famous court-painter, and which passed, amid the disasters which befell Mantua in the XVIIth century, into the possession of an English monarch, shows the true Roman spirit in its stately dignity—"the sacrificial beasts wreathed with garlands, smoking incense, the captives, the trophies, helms, corselets carried aloft on spears . . . the war-elephants advancing in stately line heralded by beautifully-draped youths." But it has not yet been given to the XXth century to produce a Mantegna; and the hint contained in these figures at Hampton Court was either not known or not accepted.

The work of Dazzi reaches, in fact, its highest point in this seated figure of Rome, a creation of which he may well be proud; she may be perhaps a little exaggerated in size, but both this and the surrounding groups fit well into the spaces assigned them, the light and shadow is effective, the nudes correct and vigorous, though the sculptor never seems to get far away from his somewhat coarse type of the workers in his "*Lavoratori*" and "*Costruttori*," and his women, rarely introduced, are entirely deficient in charm.

It is obviously force, not grace of form, which dominates the impulse of the young sculptor. Young as he is, he has brought himself by a series of works full of talent and character, culminating in this really fine design for the "Monumento," prominently before the notice of the European public, and we shall watch with appreciative interest for the next steps in his artistic development. S. B.

THE ARCHITECTURE OF PORTUGAL.—IV.

(*Continued from page 579.*)

THE great effort of Batalha bore fruit in a widened experience, which shows itself in a number of churches built during the XVth century, many of them modelled in some way or other upon it, and laid the basis of the one really national style, the style which came into flower as Portugal drew to the zenith of her fortunes. In particular, this period witnessed a great development in vaulting skill, which enabled the builders to vault over wide spans, and that in a manner not found elsewhere on the Continent, and without recourse to the involved and contorted ribs in use in Spain and elsewhere. An early example of this type, which at Belem approached so nearly to English fan vaulting, occurs in the Church of Villar de Frades, begun in 1425. As the century advances we have the Graça at Santarem, São João Baptista at Thomar, the Matriz at Villa do Conde, Sta. Maria dos Anjos at Caminha, and the Church of Azurara, all interesting as illustrating in various ways the growth of the Manoelino style, named from the glorious reign of Dom Manoel I. (1495–1521), in which it culminated, though most of its elements were already present and commingled under his immediate predecessors. The whole trend of Gothic art in the XVth century on the Continent was towards restlessness and virtuosity, manifested in intricate structure and exuberant ornament, and at the same time towards naturalistic treatment. In Portuguese Gothic the tendencies were as strong as elsewhere, and formed the groundwork of the Manoelino style, but it also absorbed the circumambient influences of its environment. Among these the most easily distinguishable is that of the Moors, settled for so many centuries in the land itself. Next in view of the agelong maritime intercourse of Portugal with the Netherlands, Flemish and perhaps even German influence is not improbable, even before the XVIth century, when Flemish artists are known to have been imported, while certain forms recall the cognate but on the whole less angular manner of Northern France. Again, *pace* Mr. Crum Watson, who strenuously, but not altogether successfully, combats this view, an Indian flavour is probably to be discerned in at least some examples of the later style. When it is remembered that after Vasco da Gama had reached Calicut in 1497 a Portuguese colonial empire was at once founded in India, and an active commercial intercourse with that country immediately sprang up, it is reasonable to suppose that an art so striking and original as that with which the Portuguese there came into contact for the first time, and specimens of which in the form of small articles doubtless returned in each shipload of silks and spices, would produce an effect on the native style. It is not contended that specific buildings in India were imitated, but rather that the builders and carvers had in their minds vague reminiscences of Indian architecture, and before their eyes the patterns of Indian carved or inlaid or woven work, and the forms employed by Indian metal workers and cabinet makers. Then came the Renaissance, and to this welter of competing influences yet another was added by the Italian and French artists working in the new style. Thus in the later examples of Manoelino the friezes and arabesques, the pilasters and candelabra, and the whole code of Italian ornament were more or less skilfully interwoven.

Phenomena indistinguishable from some forms of Manoelino, but without the Indian element, appear in certain parts of Spain, but there the style was but a passing phase which took no root. As instances, a doorway of the south-west cloister of the Hospital of the Catholic

Fig. 1. Doorway in the Hospital of the Catholic Kings at Santiago de Compostella.

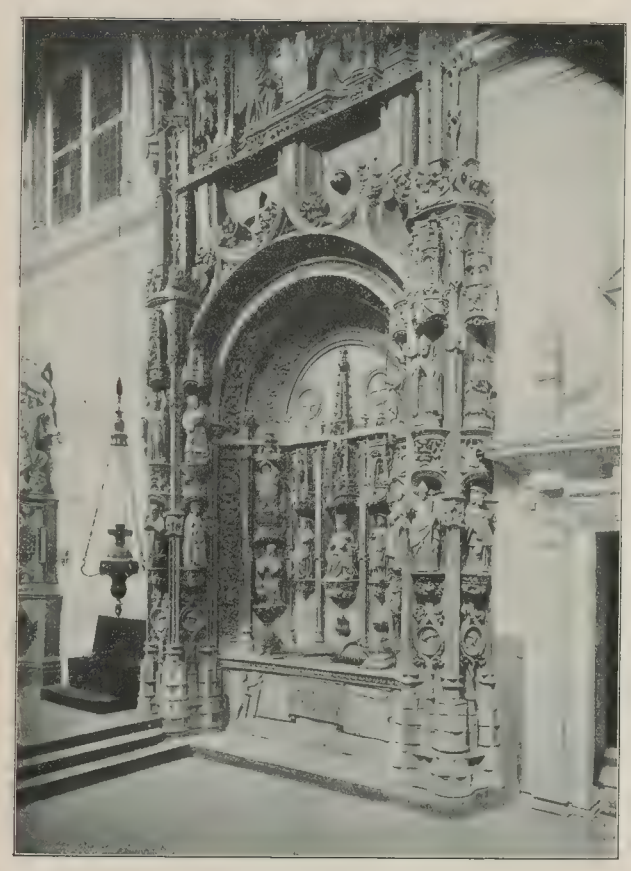

Fig. 3. Tomb of Dom Sancho I. in the Choir of Santa Cruz at Coimbra.

Kings at Santiago de Compostella (Fig. 1) and the court of the Infantado Palace at Guadalajara may be mentioned. Manoelino is in the main a style of decoration affecting but slightly the main lines of plan and structure, but fastening upon the more prominent features, particularly the doors and windows, the piers and arches, and enveloping them in a web of exuberant fancies.

The characteristic tendency of late Gothic to elaboration and complexity brought about the multiplication of members in the piers and the surrounds of openings where they were interwoven and interpenetrated. This was combined with the Moorish cusping and interlacing of arches. As elsewhere, too, the simple pointed form of head gave place either to the round or to some more complex shape, such as the polygonal with straight or curved sides, or that given by two lobed arches, one with convex and one with concave curves, occasionally varied by straight lines being intertwined. The prevalent roll mouldings are laced into various patterns, some of them reminiscent of Romanesque types, and spiral shafts are frequent. The elaboration of the outer wall as the inner outlines of features follows as a matter of course. Openings are framed in by label mouldings curiously bent into gables of complex curvature, which burst into a forest of crockets and finials, while the skyline is fretted with pierced crestings and jagged with pinnacles; and the surfaces of shafts, the spandrels and the panels are carved with bands and diapers of ornament.

The naturalism of the age was not content to bind wreaths round the capitals and trail leafy sprays in the hollows of the jambs; it seized upon the roll mouldings and twined them into cables, which it looped and knotted and tasselled, or into growing stems springing from writhed roots and sprouting with twigs, sometimes lopped in German fashion, sometimes bearing thick bunches of coiled fronds. In windows and cloister arcades stems such as these spread above into lace-like veils of intertwined branches and sprays in lieu of tracery. At other times it would transform a cluster of shafts into a bundle of reeds bound together with ropes or ribbons. The finial which juts from each point of the interlaced cusping, from each angle of the drip mould, and from the summit of every pinnacle becomes a spike of flowers or a knot of leaves.

The Manoelino style, however, is far from being homogeneous, for all its elements are seldom found blended in the same work, and examples from different places and even different parts of the same building differ so greatly from each other that they have little more than the general characteristic of extreme exuberance in common. The period which produced the style was one when the wealth of Brazil as well as the East was pouring into the coffers of Portugal and the lovers of building were able to give free rein to their hobby. Foremost among these was the prince who sat on the throne under the name of Dom Manoel the Fortunate, a typical Renaissance monarch, a splendour-loving patron of art and learning, a Francis I. without his vices. Since, however, over sixty buildings were erected at his expense alone, these articles must confine themselves to a brief description of the salient points in a very few of them.

The portion added by Manoel to the old palace of Cintra is a good example of the earlier style. Here the windows of the eastern wing are of a Moorish type with coupled, semicircular headed, cusped arches enclosed in a rectangular framework, but the latter is formed of twisted and budding branches, which blossom into rich poppy heads above. The Church of the Monastery of Santa Cruz at Coimbra is a relatively sober example of the style without perceptible Moorish influence, and recalling rather a French or Flemish church by the form of the crocketed spires of its turrets and the pinnacled buttresses and swirling labels of its west portal (Fig. 2). In the cloisters, however, a less skilled hand betrays itself, and the segmental arches filled with clumsy tracery, in which the bars are composed of a coarse cable mould, are far from happy in effect. The church contains the tombs of two of the early kings, erected under Dom Manoel (Fig. 3). Almost identical in design, these lofty and elaborate structures reaching to the roof face each other on each side of the choir. Though purely Gothic in general treatment, they exhibit many of the soberer Manoelino characteristics, and were probably designed by a Portuguese. Some of the statuary, however, and sundry Renaissance details introduced here and there are doubtless due to one of the various Frenchmen employed in the church, among whom were Master Nicolas, who had previously worked at Belem and Jean de Rouen, who had collaborated in the Amboise tomb in Rouen Cathedral up to 1521 and afterwards executed the Renaissance pulpit and other works here.

The western choir gallery is fitted with a magnificent series of Gothic stalls (Fig. 4 richly carved and gilded, probably, to judge by the Flemish character of their detail, by the same Flemings who made the reredos of the old cathedral in the same city. Above the canopies runs a deep frieze with foliage cresting, divided by statuettes in niches into panels in low relief, representing the adventures of Vasco da Gama in India. Another example of Flemish workmanship, the choir stalls in the Church of the Order of Christ at Thomar, has unfortunately perished.

EGYPTIAN AND SYRIAN EXPLORATION.

THE last campaigns carried out by the various agencies interested in the exploration in Egypt have been quite up to the average in fruitfulness. Mr. Edouard Naville's work for the Egypt Exploration Fund was in part devoted to further investigations at Abydos, a spot of great sanctity owing to its possession of the reputed tomb of Osiris, in the vicinity of which innumerable kings and other personages had tombs or cenotaphs. He explored a mysterious underground passage, the door of which had been found by Professor Petrie and Miss Murray. It is cut in the marl, and its walls have well-preserved decorations illustrating the Book of the Dead. The roof, consisting of stone lintels 9 ft. long, had at some period been mostly removed. The passage sloped down for some way and eventually led to a series of large subterranean chambers, the purpose of which is not yet clear, but which are considered by Professor Naville to be in some way connected with the tomb of Osiris.

In the course of their more recent work the British School, under Mr. Mackay, were fortunate in finding at Memphis, between two well-known colossi, a gigantic sphinx of the finest work of about 1300 B.C. in excellent preservation though thrown on its side. It is of alabaster and weighs about 80 tons, its measurements being 14 ft. high and 26 ft. long. It will be set up again and remain in position. Professor Petrie, likewise working for the British School, has begun excavating Heliopolis, destroyed by the Persians in 525 B.C., as the key to Memphis, and never since occupied. The massive walls of the temple enclosure, some 40 ft. thick, have been traced out, and an earthwork fort disclosed similar to that discovered at Tell-el-Yehudich in 1906, a rounded square in plan, a quarter of a mile across. It is assigned to the Hyksos period, being a form of construction quite foreign to native Egyptian practice.

Professor Garstang resumed this winter the explorations of Meroë in the Sudan, under the auspices of Liverpool University, begun in the previous year, and traced the city wall for upwards of 1,000 ft. These are 16 ft. thick and were once from 30 ft. to 40 ft. high. A Roman temple and the baths attached to a palace were also discovered, and in the latter a number of works of art, statuary, medallions, frescoes,

glazed ornaments, and tiles, while the palace of Queen Candace yielded a quantity of jewellery.

One of the most interesting of these objects is a remarkably fine contemporary bronze head of Augustus with the eyes enamelled, which has been purchased by the National Collections Fund for 1,000 guineas, a transaction which has brought down two very desirable birds with one stone—the British Museum is enriched by a valuable work of art, and the Liverpool Fund is able to carry on its work for another year.

A similar spirit of enterprise is manifested by the Ny Carlsberg Museum of Copenhagen, which paid for part of the works at Memphis, and is rewarded by the acquisition of a red granite group of Rameses and the god Ptah, found in that deity's precinct.

The activities of the Liverpool University Expedition are not confined to the Sudan. When the summer comes round Professor Garstang seeks a cooler climate. Last summer was devoted to exploration in the neighbourhood of Antioch, and in particular to that of an artificial mound at Sakje-Geuzi, 500 ft. long and 160 ft. high. It concealed remains of many periods. A Roman building complete except for its roof was uncovered, fine fortifications of the Seleucid period, and, lowest of all, remains of Hittite building dating from about 1500 to 600 B.C. In the Hittite houses of the earlier date traces of charred wooden roofs and verandahs gave evidence of destruction by fire. A smaller mound near by proved to have been the royal residence, whose plan was recovered. The palace stood in the angle of a strongly fortified rectangular enclosure.

HISTORICAL NOTES.

Tudor House, Southampton.

THIS fine timber-built house—known generally as "Henry VIII.'s Palace"—has been purchased by the Corporation of Southampton under the Museums Act. It is intended to make it a representative local museum and a centre of interest for the whole of Hampshire. Erected probably in the early part of the XVIth century, it is well worth study; and it is fortunate that it has now become the property of the town. It is interesting not only in itself, but from its position in the old town, and from its close association with other historic buildings and the ancient walls in this quarter. It stands at the south corner of St. Michael's-square, facing the main (west) entrance to the church. Tradition connects it with visits of Henry VIII. to the town, and some have indulged their fancy in picturing Henry here with Anne Boleyn; but, though it is recorded that the King came several times and Queen Catherine certainly once, there is no evidence that Anne was here at all, or that the King ever visited Southampton after Catherine's divorce. Bugle-street, of which this building forms a part, takes its name from a house which stood at the south corner of West Gate-street, and was named Bugle Hall. It had some distinguished owners, one of whom was the celebrated Sir Thomas Wriothesley, Earl of Southampton. Englefield, in his well-known work (1801), states that it was completely destroyed by fire "a few years ago."

Preservation of Historical Structures.

REPORTS from all parts of the kingdom attest the growing strength of the movement for the preservation of ancient buildings and objects of historical interest. The following are examples taken almost at random:—

At a meeting of the County Council of Renfrewshire last month reports were received from a number of members on the buildings and ruins in the county whose preservation should be aimed at, and also a return from the clerks of the various parishes enumerating the structures of historical interest existing in each parish. The Surrey Archæological Society has undertaken to draw up a similar list for Surrey, while the County Council is taking steps to preserve ancient cottages at Guildford which are threatened. On June 6 was held the final meeting of the Ayr Auld Brig Preservation Committee, through whose efforts that picturesque bridge with its reminiscences of Burns has been saved from destruction and repaired at a cost of over 12,000*l.*

The National Trust has just issued an appeal for the acquisition of a Roman fort known as Borran's Field, near Ambleside, which is not only interesting as forming part of the system of block-houses erected by the Romans to control the lake district, but a beautiful spot, on the edge of Windermere, whose conversion into a building site would be a disfigurement of the lake. The site—of 20 acres—is offered for 4,000*l.*, of which 1,000*l.* has been promised locally.

Efforts are being made to arrest the destruction by time and weather of the ruins of the Priory Church of St. Botolph, Colchester. The Priory, the oldest house of Augustine Canons in England, was destroyed at the Reformation with the exception of the nave of the church, which was granted to the parishioners for public worship. In the siege of Colchester by Fairfax in 1648 this parish church of St. Botolph suffered severely, as it stood between the fires of the besieged and besiegers. It has since been abandoned, and is now in a critical condition, urgently requiring attention, which it is hoped the Board of Works may be disposed to give it.

Honiton Church.

THE rebuilding of St. Michael's Church, Honiton, which was all but burnt down in August, 1911, is now nearly complete. The tower, portions of the walls, and many of the arcade piers survived the fire, and have been incorporated in the new structure. Many of the old floor memorials remain intact and are left in position in the new flooring. Other monuments, though damaged, also survive. Notable among these is the beautiful black marble tomb of Thomas Marwood, physician to Queen Elizabeth, who died at the age of 105. The famous Perpendicular screen erected during the episcopate of Bishop Courtenay (1477–91), Shakespeare's "haughty prelate" (*Richard III.*), was unfortunately entirely destroyed in last summer's disaster.

Discoveries at a Dorset Church.

UNDER the above heading the *Times* of June 6 gives an account of some discoveries made in the course of restoration at Whitcomb Church, which was already interesting for the possession of two rude Romanesque doorways, probably of pre-Conquest date. A finely-carved "Celtic" cross has been found embedded in the east wall of the chancel.

"The rood-loft steps have also been discovered, having been walled up probably during the Puritan period. The removal of the plaster on the north wall of the nave has revealed a large extent of fairly well-preserved fresco, representing rather florid XIIIth-century arcading.

Whitcomb was the first pastoral charge held by the dialect poet, William Barnes, a "living" of 13*l.* per annum.

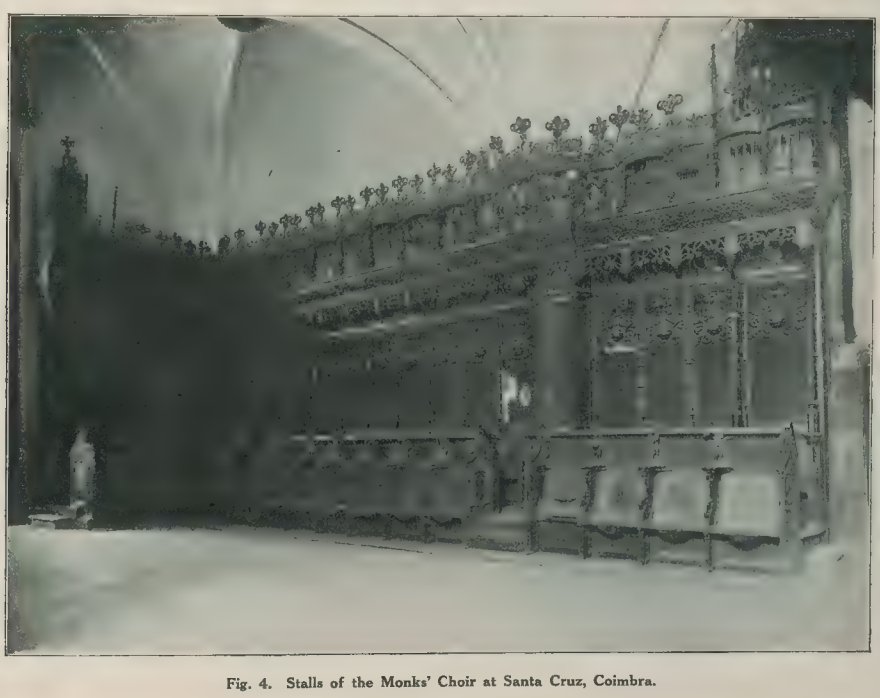

Fig. 4. Stalls of the Monks' Choir at Santa Cruz, Coimbra.

THE BUILDING TRADE.

CO-PARTNERSHIP AND LABOUR UNREST.

A NON-PARTY movement has been set on foot with the object of promoting co-partnership between labour and capital as a remedy for labour troubles and to investigate the causes of failure and success in those schemes which have hitherto been tried. At the same time a tentative Bill has been introduced and read a first time in the House of Commons dealing with this subject. Everyone would welcome a solution of labour troubles which would not only secure to labour an interest in the industry it is engaged upon, but which would also put an end to a kind of strife which benefits no one in this country and which is permanently driving our trade abroad. There are many inherent difficulties in co-partnership schemes; they necessitate restrictions on the use of capital, and the workmen, though they can share profits, can neither provide capital nor share losses. In the case of industries which are keenly competitive these difficulties are increased, whilst in undertakings such as the South Metropolitan Gas Works they are at the minimum. The chief obstacle in the way of such schemes is, however, the attitude both of the trade unions and the Government towards the sympathetic strike. The modern weapon of labour is the general strike; a dispute in one trade in one district, however trivial, is made the pretext of a general cessation of work in affiliated trades throughout the country. It is obvious that so long as this is the policy of the labour leaders they must discourage any movement which attaches labour either to an employer or a trade. All labour must be so detached that the bugle call to battle may unhesitatingly be answered at once. Hence the relations between employer and employed become daily more detached and less friendly. Happily there are now signs in the country that the workmen are tiring of this destructive policy of striking in sympathy, and thus we may hope that more rational methods of conciliation and co-partnership may soon receive a fair and patient trial.

CONCRETE-MIXERS:

THE RANSOME MIXER.

THIS machine, which is supplied in several different styles to suit individual requirements, is of the batch-mixing type.

The mixer proper consists of a rotatory drum fitted inside with scoops of special design, the concrete being discharged from a shoot which is raised during the process of mixing, and lowered when the concrete has been mixed. Fig. 1 is a view which shows the general arrangement of the machine.

The drum is built of substantial steel plates riveted together, and rotates upon two circular cast-iron roller paths riveted to the exterior, the path nearest to the delivery shoot being fitted with an annular toothed rack. In the smaller machines the rack is cast in one with the roller path, and in machines of the larger sizes it is in the form of a separate casting.

The paths are spaced as far apart as possible in order to obviate the oscillation that occurs in machines where the roller paths are at or near the centre of the drum. In addition to ensuring steady running, the wide spacing has the effect of increasing the life of the drum.

The frame carrying the drum is constructed of rolled-steel sections strongly connected together. Brass bearings are bolted upon the frame to support the axles of four cast-iron rollers on which the drum rotates. Bearings are also provided for the driving shaft, fitted at one end with fast and loose pulleys, and at the other end with a cast-steel pinion engaging the annular toothed rack on the drum. All bearings are brass bushed, and the pedestals are made in two halves so as to be adjustable. Moreover, the bearings are made dust-proof by a special arrangement of caps and packing pieces, this being an important feature in concrete-mixing plant.

The discharge shoot is of steel plate and fixed in place by means of three vertical angle bars, to the top of which are bolted cast-iron brackets carrying a quadrant and shaft supporting and moving the shoot up and down as may be required, the movement of the shoot being effected by a hand lever.

While a batch of concrete is being mixed the shoot is raised, and as soon as it is desired to discharge the concrete the lever is thrown over, causing the shoot to fall. The concrete then passes direct into the barrow or other receptacle placed beneath the shoot, the entire batch being discharged in five revolutions of the drum.

Fig. 2 illustrates the construction and arrangement of the steel scoops inside the drum, the scoops ploughing through, picking up, and distributing the materials while the drum revolves, in the manner approximately indicated by Fig. 3.

The Ransome mixer is provided with a

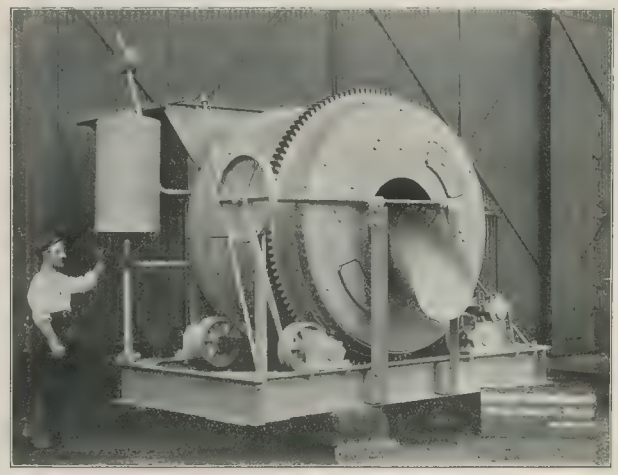

Fig. 1. Ransome Belt-Driven Mixer with Fixed Measuring Hopper.

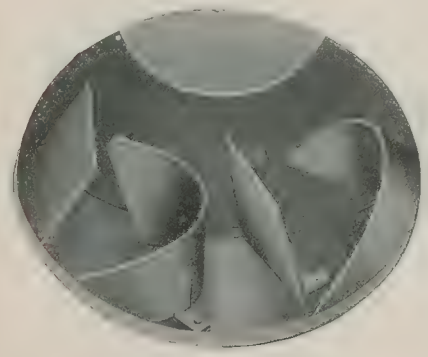

Fig. 2. Interior of Ransome Mixer.

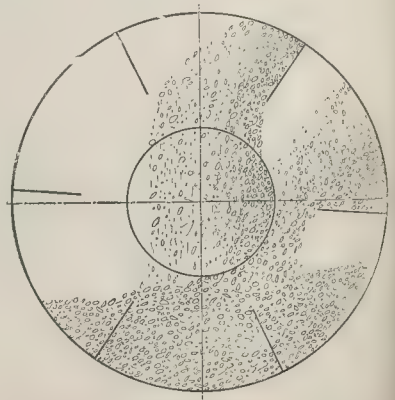

Fig. 3. Diagram Illustrating the Process of Mixing.

measuring feed hopper, either stationary or arranged so that it can be lowered to receive materials and raised to discharge them into the drum.

After the drum has been charged the gate of the hopper is closed and the hopper again charged in order that mixing may be conducted with a minimum amount of interruption.

The machine is also fitted with a water-measuring tank, having an automatic device for delivering the predetermined proportion of water for every batch of concrete.

Fig. 4 is a section of the water-tank, supplied through the valve A, and the screwed pipe D. The float C closes a valve E when the tank is full of water, and by closing the valve A

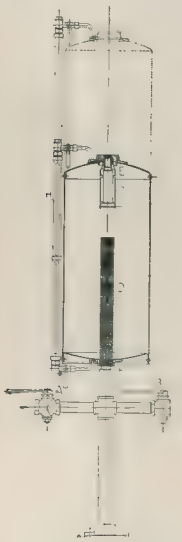

Fig. 4. Ransome Automatic Water-Tank.

and opening a valve B the water flows into the mixing drum until it falls to the level of the top of the pipe D. By screwing the pipe D up or down any required amount of water can be admitted to the drum.

The Ransome mixer is made in sizes ranging from 2 cubic ft. to 2 cubic yds. batch capacity. The frame can be supplied with wheels suitable for road or rails to enable the mixer to be moved readily from point to point, and the machine is finished in various styles for driving by belt from an existing engine or motor, or for being driven by steam engine, internal combustion motor, or electric motor mounted on the frame of the mixer. Another pattern that is often found convenient is one including hoisting apparatus for raising the concrete to the upper floors of a building under construction, the hoist being operated by the man in charge of the mixing machine.

The Ransome concrete-mixer is manufactured by Messrs. Ransomes & Rapier, Ltd., of Ipswich, and supplied by the Ransome-ver Mehr Machinery Company, of Caxton House, Westminster, S.W.

BUILDING ACT ANOMALIES.

THE amusing article we published last week by an architect on the anomalies in the London Building Act draws attention to several points of importance.

With one of his puzzles, however, perhaps we can assist him. We refer to the two instances he gives as to party walls, but he appears to have an excellent legal adviser in "Mr. Quibbles"!

In the case of Drury *v.* Army and Navy Auxiliary Co-operative Society (1896; 2 Q. B. 71) it was held that a party wall when it gets a certain height above the roof of the adjoining building ceases to be a party wall unless there is some statutory provision to make it a party wall above that height. This decision followed a case under the Bristol Improvement Act, 1840, decided in 1873, and the two cases justify "Mr. Quibbles's" opinion in the case of "Mr. D.'s" house, which had a window in a wall "much higher" than "Mr. C.'s" house. When we come to the dormer window erected in "Mr. E.'s" house we find there is a statutory provision qualifying the above statement, to wit, sect. 59 of the London Building Act, 1894. That section makes it necessary to carry up a party wall in buildings, not of the warehouse class, 15 in. above the flat or gutter, and 12 in. higher than any turret, dormer, lantern light, or other erection of combustible materials fixed upon the roof or flat of any building within 4 ft. of such party wall. We can only assume, as did the infallible "Mr. Quibbles," that the dormer window answered this description, and in this case the law is not such "a hass" as we are bound to admit nowadays it often is.

THE INCORPORATED BRITISH INSTITUTE OF CERTIFIED CARPENTERS.

ON Saturday last week a dinner was given to this Institute by the Worshipful Company of Carpenters, in the Hall of the Company, London-wall, the Master of the Company, Mr. W. R. Cobay, presiding. There were also present, representing the Carpenters' Company: Messrs. Frank Preston, B. J. Jacob, Arthur Jacob, Walter Smith, Percy Preston, Wm. Robertson, Lieut.-Colonel A. C. Preston, and J. Hutton Freeman (Clerk). Representing the Incorporated British Institute of Certified Carpenters there were present:—Professor Elsey Smith and Mr. H. P. Fletcher, F.R.I.B.A., Vice-Presidents; Professor Hy. Adams and Mr. W. Busbridge, Hon. Fellows; Mr. F. G. Rice, ex-President Institute of Builders; Mr. W. T. Sweett, Hon. Secretary; and others.

The loyal toast having been honoured,

Mr. George Ayres

proposed the toast of "The Worshipful Company of Carpenters." In the course of his remarks he expressed the indebtedness of the members of the Institute to the Carpenters' Company for its work on behalf of the craft and its help to the Institute. The Company was to be thanked especially for instituting their examinations, which were very thorough, though students received at the hands of the examiners that kindly treatment which they should expect. The Carpenters' Company had always taken an interest in the trade, and they were now in the van in regard to secondary education, their Trades Training School at Great Titchfield-street being the first school in London which one could really call a trade school. The sanitary examinations of the Company were also of great value and were held in high repute. Then as to the public, he believed that a great work was being done as a result of the lectures which were held in that Hall in the art of building and in the arts connected with building. Without the Carpenters' Company this Institute could not have been in existence, and they were very grateful for the help they had received.

Mr. W. R. Cobay,

the Master, in reply, said they met under the shadow of a great misfortune, as the President of the Institute, Mr. Wilson, was unable to be present on account of a recent motor-car accident. Mr. Wilson was on the way to recovery, and he thought they should send him a letter regretting his accident and wishing him a speedy recovery. He agreed with Mr. Ayres that the Company was a living City Guild, as they still represented a living trade, and, he hoped, a prosperous trade. The Carpenters' Company received its Charter upwards of 500 years ago, and from that day to this they had not lost touch with their own craft. In the past they had occupied a most important position in relation to the trade, having to settle many trade disputes; but differences were settled on a friendly basis, as he wished they always were now. It had been said that the City Companies were of no use except to themselves, as they ignored the requirements of the public; but he thought he could say that they were assisting craftsmen in the trade and were doing something in the matter of apprenticeship.

Mr. B. J. Jacob, J.P.,

then proposed the toast of "The Incorporated British Institute of Certified Carpenters," referring to the growth of the Institute, and said that, although they were not members of the Carpenters' Company, the Company looked upon them as part of the family, and they wished them every prosperity. A certified carpenter was a guarantee of good work.

Mr. Herbert Phillips Fletcher, F.R.I.B.A.,

in reply, thanked the Carpenters' Company on behalf of the Institute for entertaining them to dinner that night. The Company was formed many years ago for the purpose of protecting the members of their craft; in other words, it was a great trade union, but a trade union not on the question of a minimum wage or a maximum wage, but a trade union for the good of the craft. It seemed rather hard that a man who worked hard and earned 1s. 6d. per hour should be put on the same level as the "slacker" who was not earning half his 10½d. per hour; and he believed in every man being paid for the work he did. Although it was essential that some sort of minimum wage should be paid, he thought that a man should be paid for what he really did, although he admitted that it was a difficult matter to arrange. He had always taken an interest in their Institute because the first qualification of a member was that he should be a competent craftsman, and he had the greatest respect for a man who could work decently with his hands. But he did not think the Institute was going forward fast enough, and he thought they had rather got into a groove, and it was for them, and not for the President or Vice-Presidents, to work themselves out of that, and they ought to do it. It was not the fault of the officials that the Institute was not going ahead quickly enough, for they could not have better officials; what was wanted was that the backbone of the ordinary members should be put into the work of expansion. The Carpenters' Company had done a great deal for them, but the members of the Institute were not doing as much as they might. They could see what energy and push had done in other societies, and, as carpentry was never so alive as it is to-day, he thought they ought to increase their membership and get a real grip of the trade and take such a hold as the old Carpenters' Company had 500 years ago. They had to put matters on the right lines, and they should put the Institute in such a position that membership should be regarded as the highest honour that a carpenter could attain to, and in this way the cream of the trade would come to their members. He thought that architects should be encouraged to ask whether the men who were working on their jobs were members of the Institute. Personally he frequently did so.

Mr. J. D. Macnair

then suitably proposed the toast of "The Visitors," and referred to the Library of the Carpenters' Company, which the members of the Institute were permitted to use. He wished that every young man connected with the trade should know something about the Carpenters' Company, and especially about their examinations. It would be an incentive to a lad entering the trade to know of these examinations and to be encouraged to compete for them.

Mr. F. G. Rice

briefly replied, and remarked that the Company had always taken an interest in education, as was shown by the fact that they used to lend that Hall to Mr. Busbridge's School for the distribution of prizes. When he was a young man there were no technical school at Titchfield-street, no London County Council continuation schools and such educational facilities, but Mr Busbridge's school did good work.

THE BRITISH FIRE PREVENTION COMMITTEE'S TESTS.

THE British Fire Prevention Committee's summer season has now commenced at the conclusion of the Whitsuntide vacation, and an interesting programme of fire tests has again been arranged for at the Committee's Regent's Park Testing station.

The tests include the following for the coming two months, and applications from members and subscribers who wish to attend should be addressed in writing to the Assistant Secretary of the Committee at 8, Waterloo-place:

Two tests with "Chadrac" fire-resisting

electro-glazing submitted by Messrs. Chater & Sons, of London.

A test with Luxfer fire-resisting electro-glazing submitted by Messrs. British Luxfer Prism Syndicate, Ltd., of London.

A test with a large reinforced concrete floor submitted by the United States Steel Products Company, on behalf of the American makers of "Triangle Mesh Reinforcement."

A test with a pair of experimental reinforced concrete doors submitted by the Chairman of the Belgian Technical Committee for Fire Protection.

A test with asbestos-cement corrugated roofing materials (made in Canada) submitted by the Asbestos Manufactures Company, Ltd., of London.

A series of tests with impregnated textiles, wearing apparel, and similar materials submitted by Messrs. Snowden & Co., Ltd., of London.

A non-inflammable celluloid known as "Cellit" submitted by the Bayer Company, Ltd., of London.

A test with a fire extinguisher (made in England) submitted by the Abbé Daney Fire Extinguisher Company, Ltd., of London.

The Fire-Prevention Committee have further either issued or arranged to issue during June reports on the following tests conducted during the first session of the year, *i.e.*:—

A test with the Abbé Daney Fire Extinguisher (made in France).

A test with two metal doors of the Dahlstrom Metallic Door Company, Jamestown, New York, submitted by Messrs. Roneo.

A partition of the Dahlstrom Metallic Door Company, of Jamestown, New York, submitted by Messrs. Roneo.

Two tests with "Copperlite" fire-resisting glazing submitted by Messrs. Hayward Brothers & Eckstein, Ltd.

NATIONAL INSURANCE ACT.

IN Tuesday's Parliamentary Papers, Mr. Butcher asked the Chancellor of the Exchequer whether, in cases where a master builder or other employer in a trade mentioned in the Sixth Schedule to the National Insurance Act employs a son of the age of sixteen and upwards in his trade wholly or mainly by way of manual labour and pays such son wages, such son must become insured against unemployment under Part II. of the Act and he and his father must pay the contributions mentioned in the Eighth Schedule to the Act: and whether the Board of Trade have yet made regulations for the payment and collection of such contributions, and, if so, how and to whom such contributions are to be paid.—Mr. Robertson replied that a son employed by his father in the circumstances mentioned in the question would appear to be a "workman" as defined by sect. 107 (1) of the Act, in respect of whom contributions to the unemployment fund are payable at the rates set out in the Eighth Schedule and in accordance with the regulations of the Board of Trade.

GENERAL BUILDING NEWS.

PARISH HALL, CROSBY.

The new Parish Hall for St. Luke's Church has been erected at a cost of about 3,500*l.* from the designs of Messrs. Woolfall & Eccles, FF.R.I.B.A., of Liverpool. The hall provides accommodation for 500 persons, and other rooms include lecture, club, and class rooms.

NEW BATHS, WALLSEND.

The new public baths have been erected from the plans prepared by Messrs. Liddle & Browne, architects, of Newcastle. The swimming-bath hall is 118 ft. long by 56 ft. wide, with galleries and accommodation for about 700 people. The builders were Messrs. W. Franklin & Son, of Newcastle, and the engineer was Mr. T. D. Hall, of Wallsend.

MINERS' HOMES, MURTON.

The twelve homes which are being erected for aged miners at East Murton, have been designed by Messrs. C. Johnson & Son, architects, of Bishop Auckland. The houses are of one story, built with faced bricks up to the window and finished rough cast and roofed with Westmorland slates. The builders are Messrs. J. & T. Parker, of Sunderland.

BRANCH LIBRARY, BRADFORD.

The new branch library at Great Horton, Bradford, is being erected at a cost of about 3,500*l.* from the plans of Mr. W. Williamson, the City Architect. The library will have accommodation for 12,400 volumes and reading rooms are provided for adults and children, and the upper floor will be entirely devoted to a ladies' reading-room.

NEW BUILDINGS IN LONDON.

Leather warehouse, Weston-street, Bermondsey, S.E.; Mr. A. E. Anderson, architect, 35, Abingdon-street, Northampton; Messrs. J. Greenwood, Ltd., builders, Arthur-street West, E.C. Factory for Messrs. Park, Davies, & Co., chemical manufacturers, Staines-road, Hounslow, W.; Messrs Edmeston & Gabriel, architects, Union-court, Old Broad-street, E.C.; Mr. W. Downs, builder, Hampton-street, Walworth, S.E. Club premises, Bermondsey, S.E.; Mr. A. W. West, architect, 3A, Lyall-street, Belgrave-square, S.W. Offices for Bank of South America, Moorgate-street, E.C.; Messrs. Dunn & Watson, architects, 35, Lincoln's Inn-fields, W.C. Hospital, Maida Vale, W.; Messrs. Young & Hall, architects, 17, Southampton-street, W.C.; Messrs. J. W. Falkner & Co., builders, 24, Ossory-road, Old Kent-road, S.E. Chapel, Collyer-place, Camberwell, S.E.; Mr. L. G. E. Stelling, on behalf of the Building Committee of Hanover Chapel, Peckham, S.E. Rebuilding Nos. 51 and 52, Chancery-lane, and 22 and 23, Southampton-street: Messrs. Thurgood & Martin, surveyors, 27, Chancery-lane, W.C.

TRADE NEWS.

The "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air-inlets, has been supplied to Messrs. Vickers', Ltd., new offices, Barrow-in-Furness.

In reference to the illustration of Nos. 48-52, Fleet-street, E.C., for the "Norwich Union" Insurance Society, which we published in our last issue, Messrs. Patman & Fotheringham, Ltd., are the general building contractors for the work.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

AT the last meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontage and Projections.

Brixton.—Iron structure upon the forecourt of No. 205, Clapham-road, Brixton (Mr. H. J. Doughty).—Consent.

City of London.—Oriel window at Fenchurch-chambers, Lime-street, City (Messrs. Fair & Myer).—Consent.

Dulwich.—Projecting porch at No. 51, Underhill-road, Dulwich, next to Bellvoir-road (Messrs. H. King & Son for Mr. D. Rose).—Consent.

Hackney, South.—Erection of buidings on the eastern side of Lower Clapton-road, Hackney, northward of No. 208, Lower Clapton-road (Messrs. J. Garey & Son for Messrs. F. W. Glover & Son).—Consent.

Hammersmith.—Projecting sign at the Temperance Billiard Hall, King-street, Hammersmith (Temperance Billiard Halls, Ltd.).—Consent.

Hammersmith.—Projecting illuminated sign at the "Red Cow" public-house, Hammersmith-road, Hammersmith (Messrs. Bull & Bull).—Consent.

Hampstead.—Erection of additions at No. 40, Canfield-gardens, Hampstead, next to Fairhazel-gardens (Mr. C. Saunders for Mr. B. Groner).—Consent.

Hampstead.—Erection of a one-story shop in front of No. 335, Finchley-road, Hampstead (Mr. W. A. Forsyth).—Consent.

Hampstead.—Erection of a bay-window at No. 5, Belsize-road, Swiss-cottage (Mr. W. A. Watts for Mrs. F. M. Jacklin).—Consent.

Hampstead.—Erection of an addition at No. 194, Goldhurst-terrace, Hampstead (Mr. C. H. Webb for Mr. J. E. Sutton).—Consent.

Hampstead.—Erection of an iron and glass porch in front of No 44, West End-lane, Hampstead (Messrs. A. H. Paine & Son).—Consent.

Hampstead. — Erection of a projecting window upon a balcony in front of No. 22, Chesterford-gardens, Hampstead (Messrs. Spalding & Myers for Mrs. Tien).—Consent.

Kensington, North.—Erection of a wood and glass showcase at No. 124A, High-street, Notting-hill (Mr. S. Newcombe for Mrs. E. Carpenter).—Consent.

Lewisham.—Greenhouse in the garden of "Hyndford House," Inglemere-road, Forest-hill, abutting upon Bampton-road (Mr. G. Hayward).—Consent.

Lewisham.—Illuminated sign in front of No. 295, High-street, Lewisham (Messrs. B. Weatherley & Sons).—Consent.

Lewisham.—Ten houses on the western side of Perry rise, Lewisham (Mr. G. H. Paine for the Pery-rise Land Company).—Consent.

Marylebone, East.—Retention of balconies in front of Nos. 3 and 4, Princes street, St. Marylebone (Mr. W. H. White).—Consent.

Marylebone, East.—Erection of a projecting balcony at No. 89, Harley-street, W. (Mr. W. H. White for Mr. D. J. Armour).—Consent.

Marylebone, East.—Erection of iron and glass roofs over the entrances to the Tottenham Court-road tube railway-station (Mr. W. E. Mandelick for the London Electric Railway Company).—Consent.

Norwood.—Erection of a projecting sign at the Temperance Billiard Hall, Coldharbour-lane, Brixton (Temperance Billiard Halls, Ltd.).—Consent.

Norwood.—Coal store building at No. 1, Carnegie-terrace, Herne Hill-road, Norwood (Mr. H. Gardner).—Consent.

Paddington, South.—Erection of a one-story shop at No. 38, Queen's-road, Bayswater (Messrs. Veale & Gibbs).—Consent.

Paddington, South.—Projecting screen in front of No. 7, Radnor-place, Paddington (Mr. E. J. Griffiths, M.P.).—Consent.

St. George, Hanover-square.† — Wooden screen at No. 35, Warwick-street, St. George, Hanover-square (Messrs. C. E. Fry & Sons).—Consent.

St. George, Hanover-square.—Illuminated sign in front of No. 48, Dover-street, Piccadilly (Premier Wine Company, Ltd.).—Consent.

St. Pancras, West.—Illuminated sign at No. 292, Euston-road, St. Pancras (Mr. H. Monighetti).—Consent.

Strand.—Projecting balconies at No. 2, 3, and 4, Tavistock-street, Covent-garden (Mr. Lewen Sharp for Mr. G. Monro).—Consent.

Strand.—Projecting sign at the Dudley Art Galleries, No. 169, Piccadilly (Messrs. W. A. S. Benson & Co., Ltd., for the Fine Art Society, Ltd.).—Consent.

Strand.—Three illuminated signs in front of No. 149, Oxford-street (Messrs. Crane & Sons, Ltd.).—Consent.

Strand. Retention of sixteen arc lamps and an illuminated sign at No. 103, Oxford-street (Messrs. Barlow Brothers & Co.).—Consent.

Wandsworth.—Erection of one-story shops in front of "Oakmead," Balham High-road, Balham (Mr. J. J. Taylor).—Consent.

Wandsworth.—Porches to six houses on the south western side of Brudenell-road, Wandsworth, and one house on the north-western side of Ravenfield-road (Messrs. Swain & Selley).—Consent.

Wandsworth.—Projecting sign at No. 415, York-road, Wandsworth (Mr. E Pearce).—Refused.

Westminster.—Steps forming an approach to Nos. 13 to 16, Medway-street, Westminster (Messrs. H. Field & Simmons for the Right Hon. R. McKenna, M.P.).—Refused.

The recommendation marked † is contrary to the views of the Metropolitan Borough Council concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ALDERSHOT.—Business premises for Messrs. Dickenson & Co.; Messrs. Friend & Lloyd, 45A, Grosvenor-road, Aldershot.

Ammanford.—School (7,000*l.*): Mr. W. V. Morgan, architect, 24, King-street, Carmarthen.

Arbroath.—Infirmary (12,000*l.*); Mr. Hugh Garvin, architect, 42, Hill-street, Arbroath.

Armagh.—Synod Hall (4,000*l.*); Messrs. M'Laughlin & Harvey, builders, Dartmouth-road, Dublin.

Arnside.—Enlargement of parish church (2,000*l.*); Messrs. Austin & Paley, architects, 24, Castle Park, Lancaster.

Ashford (Middlesex).—Church of St. Hilda: Mr. J. S. Alder, architect, 1, Arundel-street, Strand, W.C.; Messrs. Dorey & Son, builders, Brentford.

Aspatria.—Additions and alterations to Grapes Hotel for the Maryport Brewery Company.

Ayr.—Building, Garden-street (1,000*l.*), for Messrs. W. Mitchell & Sons, provision merchants, 16-22, Main-street, Newton, Ayr.

Babbacombe (Devon).—Block of shops; Mr. T. G. Moore, architect, Fleet-street, Torquay.

Bacup.—Additions to India Cotton Mill, New Church-road, for Messrs. J. Hoyle & Son, Ltd.

Barrow-in-Furness.—Extensions to isolation hospital; Mr. A. Race, Surveyor, Town Hall, Barrow.

Barry Dock.—Drill hall; Messrs. Teather & Wilson, architects, Queen-street, Cardiff: Messrs. D. Davies & Son, builders, Trade-street, Cardiff.

Batley.—Additions to Blakeridge Mill for Messrs. J. T. & J. Taylor, Ltd., woollen manufacturers.

Bexhill.—Picture theatre: Mr. A. C. D. Hicks, architect, 4, Sea-road, Bexhill.

Bideford (Devon). — United Methodist

* See also our list of Competitions, Contracts, etc., on another page.

chapel. Mr. W. B. Rees, architect, 37, St. Mary-street, Cardiff; Mr. C. Bryer, builder, Bridgwater.

Blaby.—Alterations at workhouse (2,090*l.*); Mr. H. D. Smith, builder, 28, Central-avenue, Wigston Magna, Leicester.

Bourne.—Isolation hospital, South-road; Mr. T. Lake, Surveyor, Rural District Council Offices, Bourne.

Bristol.—Hospital (35,000*l.*); Messrs. Oatley & Lawrence, architects, Edinburgh-chambers, Baldwin-street, Bristol; Messrs. W. Cowlin & Son, builders, Stratton-street, Bristol. Academy of Fine Arts: Messrs. Silcock & Reay, architects, Milsom-street, Bath; Messrs. Dallow & Son, builders, Blackheath, Birmingham.

Burnley.—Weaving shed, Barden-lane, for the Barden Mill Company.

Burscough Bridge (Ormskirk).—Additions to seed warehouse, Mart-lane, for Messrs. J Martland, Ltd.

Cardiff.—Grand stand, Cardiff Arms Park: Mr. A. Leitch, architect, 36, Dale-street, Liverpool.

Carnarvon.—Alterations to No. 23, Castle-square, for the Prudential Assurance Company.

Cheadle.—Cottage hospital; Mr. F. S. Cox, Clerk, Guardians' Offices, Cheadle.

Cheltenham.—Additions at infirmary (700*l.*); Mr. R. R. Skemp, builder, Great Norwood-street, Cheltenham. Domestic science block, Gloucester-road School: Messrs. Chatteris & Smithson, architects, Regent-street, Cheltenham.

Chingford.—Erection of pumping station, gas-producer house, and two houses, etc. (14,818*l.*); Messrs. Charles Wall, Ltd., builders, 4, Lloyd's-avenue, E.C.

Chorley. Weaving shed, Stump-lane, for Messrs. Stuttgart & Nuttall.

Cleaden.—Sub-station, The Clusters, for the County of Durham Electrical Supply Company

Cleckheaton.—Additions to Exchange mills and offices for Messrs. C. Hirst & Sons, Ltd., wire drawers and manufacturers.

Clifton (Bristol). — Christian Brothers College: Mr. J. Bevan, architect, Liverpool-chambers, Corn-street, Bristol.

Consett. Theatre and shops, Front street, for the Consett Theatre, Ltd.

Crombie.—Workmen's hut at Royal Naval Ordnance Depôt: Messrs. Scott, Marshall, & Co., fireproof door manufacturers, 2, St Andrew's-square, Edinburgh

Dalkeith.—Conversion of St. John's United Free Church into picture palace; Mr. Wilber Harlen, Portobello, N.B.

Dartford Heath.—School: Messrs. Friday & Ling, builders, North-road, Erith.

Dewsbury.—Brass factory, etc., Jack-lane, for Messrs. Brown & Naylor, brass founders, 78, Town street, Stanninglee, Leeds.

Falkirk.—Extensions to electricity works, High Station-road (1,300*l.*): Mr J. McMillan, Electrical Engineer, Town Hall, Falkirk.

Farnham. — Proposed twenty houses, Crondall-lane: Mr. R. W. Cass, Surveyor, Urban District Council Offices, Farnham Residence near Farnham; Mr. A. H. Guyer, architect, South street, Farnham.

Filey.—Bank, etc., corner of Murray and Union-streets; London Joint Stock Bank, Ltd 5 Princes street, E.C.

Gilmerton.—School (400 places): Mr. James M. Morrison, architect, York place, Edinburgh

Glasgow. — Stores, Great Eastern-road. Messrs. A. G. Barr & Co., Ltd., mineral water manufacturers, 432, Great Eastern road, Glasgow Church hall, Calder-street and Polmadie road: Trustees, Polmadie United Free Church Shops and houses, Castle-street, for Messrs. P. & F. Sherry, wine and spirit merchants, 289 High-street, Glasgow. Alterations and additions to buildings, Buchanan-street and Germiston-street, for the Caledonian Railway Company, St. Rollox, Glasgow. Picture hall and offices, Baker-street, Langside. Mr. James Hamilton, printer, 213, Buchanan-street, Glasgow. Extensions to buildings, Stanley Street and Vermont-street, for Messrs. Hay Brothers, Ltd., confectioners, Vermont-street Kinning Park, Glasgow. Additions to bakery Hydepark-street, for Messrs. Bilsland Brothers

Grange. Parish hall, Kent's Bank-road: Messrs. Postlethwaite & Dawson, builders, Grange.

Green Street Green (Dartford). — Engine-house, cottage, etc. (2,185*l.*): Messrs. William Blay, Ltd., builders, 30A, Spital-street, Dartford.

Grimsby.—Children's homes: Mr. J F. Wintringham, Clerk, Guardians' Offices, Great Grimsby.

Hereford.—School: Mr. G. H. Jack, County Architect, Shire Hall, Hereford.

Hindley.—School (150 places): Managers, St. Nathaniel's School, Hindley

Horsham.—Large residence, St. Leonard's Forest: Messrs. J. Carter, Jonas, & Sons, Architects, 8A, Whitehall, S.W.; Messrs. Norman & Burt, builders, London-road, Burgess-Hill, Sussex.

Ipswich — Factory, Princes-street; Mr. George W. Leighton, architect, 21, Museum-street, Ipswich.

Kelloe.—Remodelling Primitive Methodist chapel (500*l.*); Mr. J. W. Hayes, architect, Wingate; Messrs. Regan Brothers, builders, Trimdon Village.

Leeds.—Proposed extensions and improvements at infirmary (150,000*l.*); Board of Management.

Llandudno.—Convalescent home (6,000*l.*); Mr. S. Salt, builder, Leek.

Llanelly.—Twenty-five houses (3,800*l.*); Mr. T. Rogers, builder, Manselton, Swansea. Bank for Lloyd's; Messrs. Waller & Son, architects, College-green, Gloucester, Messrs. Willcocks & Son, builders, 55, Darlington-street, Wolverhampton.

Lowestoft.—Plans have been passed for three houses, Camden-street; for Mrs. C. Pipe, and three houses, Beccles road, for Mr. E. Darby. Mr. C. F. Peachman has lodged plans for six houses, York-road.

Mansfield.—School, Chesterfield road; Mr. T. R. Collinge, Surveyor, Town Hall, Mansfield.

Midsomer Norton.—Co-operative premises; Mr. E. F. Bird, architect, The Island, Midsomer Norton; Mr. T. Foster, builder, Old Bath hill, Radstock.

Mountain Ash. — School; Mr. W. H. Williams, Surveyor, Municipal Offices, Mountain Ash.

Newton Abbot.—Assembly hall for Mid-Devon Constitutional Club; Mr. F. E. Lloyd-Downes, architect, 36, Queen-street, Newton Abbot.

Northfleet.—Factory for Messrs. Henley's, Northfleet.

Portland.—Council offices; Messrs. Spier & Bevan, architects, Borough-chambers, Wharton-street, Cardiff.

Preston.—Sunday school (1,500*l.*); Vicar, St. George's Church, Preston.

Reading.—Drill hall; Messrs. Hoare & Wheeler, architects, Friary-street, Reading.

St. Anne's.—Bank for Messrs. William & Deacon Banking Company, Ltd., St. Anne's-road; Mr. James Eaves, builder, 51, Booth Ley-road, Blackpool.

Seaford.—Block of shops, Clarmont-road; Mr. J. W. Hawkes, architect, Central-chambers, North-street Quadrant, Brighton.

Shaw.—Premises, Shaw Lodge Estate (800*l.*), for the Crompton Co-operative Society.

Sithney.—School (1,600*l.*); Mr. Jory, builder, Connor Downs.

Southwick-on-Wear.—Public hall, corner of Beaumont-street and The Green; Messrs. Joseph Potts & Son, builders, 57, John-street, Sunderland.

Steyning. — Board-room and offices for Guardians, Messrs. Clayton & Black, architects, 10, Prince Albert-street, Brighton.

Tunbridge Wells. Residence; Mr. H. M. Caley, architect, 29, Mount-pleasant, Tunbridge Wells.

Twickenham.—The following plans have lodged:—Five houses, Hartington-road; alterations and additions to Thistleworth Park-road, for Messrs. Brewer, Smith, & Brewer; four houses, Whitton-road, for Mr. H. G. Alaway; alterations and additions, "The Nelson" Inn, Hampton-road, for Messrs. Nowell, Parr, & Kates; addition to motor-'bus garage, Cambridge-road, for the London General Omnibus Company, Ltd.

Wakefield.—Foundry, Phœnix Works, Calder Vale-road, for Messrs. W. Green & Son, Ltd., fuel economiser manufacturers.

Warley (near Brentwood).—Large residence; Mr. H. R. Bird, architect, St. Thomas's-gate, Brentwood.

Warrington.—Buildings for imbeciles and epileptics (12,666*l.*); Messrs. W. & J. Owen architects, 4, Cairo-chambers, Warrington.

West Hartlepool. School, Stratford-road; Managers, St. Joseph's Roman Catholic School, West Hartlepool.

West Oxford. Schools; Mr. W. H. Castle, Estate Surveyor, Town Hall, Oxford.

Winchester.—Extensions and additions to Guildhall; Mr. W. V. Anderson, Surveyor, Town Hall, Winchester.

Winton.—Stables at depôt (863*l.*); Messrs Jenkins & Sons, builders, 43, Holdenhurst road, Porkesdown, Bournemouth.

Wombwell.—Baths (6,000*l.*); Mr. H. Burgess, architect, Queen Anne's-chambers, Westminster, S.W.

METROPOLITAN ASYLUMS BOARD.

At the fortnightly sitting of the Metropolitan Asylums Board on Saturday communications were received from the Local Government Board assenting to the proposal to rebuild in permanent material two of the wards at Long Reach Hospital, and approving generally of the proposals to extend the verandahs of four of the double cottage blocks at Queen Mary's Hospital, but asking for complete plans and specifications before tenders are obtained.

Lightning Conductors.—Bearing on the Engineer's report *re* lightning conductors submitted at the last meeting, it was decided that the Works Committee be authorised to arrange for the repair and provision of lightning conductors at those institutions of the Board where necessary.

Sea Defences.—It was agreed to adopt the plan of Mr. H. Howard, Surveyor, of Littlehampton, for the erection of a concrete sea wall to protect the Board's property at Rustington. The estimated cost is 450*l.*

METROPOLITAN WATER BOARD.

At the sitting of the Metropolitan Water Board last Friday the Finance Committee reported on the collection of the water rate for the last half-year. The report stated that the amount written off on account of "empties" was 61,726*l.*, or 5·38 per cent. This figure showed a satisfactory diminution on the past six half-years, there having been a continuous slight diminution each half-year from that ending September 30, 1909, when the percentage was 6·21. The amount received for building supplies during the half year was 10,893*l.*

New Reservoirs.—The Board decided to proceed with the construction of two new reservoirs at Littleton for the supply of water on the north side of the Thames, as recommended at the last meeting. The estimated cost of the reservoirs are 1,646,400*l.* and 635,000*l.*, respectively, with a further 250,000*l.*, which will be spent during the first stage for connecting the reservoirs with existing mains.

Erection of Buildings.—The Works Committee reported that, in accordance with the power invested in them, they had accepted the offer of Messrs. Charles Wall, Ltd., of 14,817*l.* 18s., for the erection of a pumping-station, gas-producer house, two cottages, and the formation of roads at the Chingford Reservoir Works. The buildings will be built with natural Portland stone dressings. They had also accepted the offer of Messrs. W. F. Blay, Ltd., of 2,168*l.* 16s. 9d., for the erection of an engine-house, cottage, etc., at Green Street Green.

PATENTS.

APPLICATIONS PUBLISHED.*

9,986 of 1911.—George Henry Pook: Fire-extinguishing sprinkler systems.

11,973 of 1911.—George Bull: Grab.

12,359 of 1911.—Johann Friedrich Meyer (J. F. Meyer): Building of walls and structures.

12,594 of 1911.—Frederick Dudley Bird: Apparatus for emptying cesspools and the like.

14,282 of 1911.—Frederick Mallott and Arthur James Mallott: Lifts or hoists.

14,506 of 1911.—Harold Clinton Ferree: Metal reinforcement for building purposes.

17,170 of 1911.—Tom Parker Whitehead: Rotary chimney-cowl.

21,370 of 1911.—Umiliano Panicali and Giovanni Brenni: Manufacture of ornamental tile slabs or the like.

22,687 of 1911.—John Parsons, jun.: Method and means for rendering walls of buildings and the like impervious to moisture.

25,038 of 1911.—Richard George Vaughan: Locking means for sash-fasteners.

25,485 of 1911.—Franz Hloch: Machines for pressing pasty masses, more particularly mixtures of asbestos and cement.

26,374 of 1911.—James Johnstone Frazer: Covering of walls, floors, ceilings, and other surfaces.

26,642 of 1911.—Wallace Lafayette Selleck: Locks.

26,737 of 1911.—Stefan von Mrokowski: Flooring for rooms and the like.

28,536 of 1911.—Guillaume Albert Amedée Ceulaers: Elastic or resilient cement.

28,927 of 1911.—Gerhard Schreiber: Portable moulding frames for making cement slabs.

1,285 of 1912.—Aktienbolaget Lux: Apparatus for lighting and extinguishing gas-fires from a distance.

3,372 of 1912.—Adolf Panzenhagen: Scaffolding.

7,544 of 1912.—Clarke Williams McKee: Gravity actuated window-locks.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

Adelphi Hotel, Liverpool: A Dining-Room, showing Inlet and Outlet Ventilation Gratings.

ADELPHI HOTEL, LIVERPOOL.—III.

(*Continued from page* 637.)

ENGINEERING EQUIPMENT.

In a large hotel building the engineering equipment is generally similar to that of a hospital or other public institution, although many of the fittings forming part of the several installations are necessarily of more elaborate and ornamental appearance.

When considering the equipment of the Adelphi Hotel the architect had to take into account something more than the requirements applying to the case of a public institution in order to comply with the desire of the Midland Railway Company that everything should be provided for the comfort of visitors without incurring such additional expenditure in running costs and maintenance as would entail disproportionate increase in the charges for accommodation.

Consequently, in selecting the machinery and apparatus for adoption, many points had to be considered all bearing upon the question of maximum efficiency, among them being the questions of first cost, value of space occupied, cost of running, attention required, depreciation, and maintenance charges.

Careful attention was also given in the designs to the installation of steam boilers, engines, and machinery in a situation where they would not constitute a source of possible annoyance to visitors. The system of heating and ventilation chosen is one obviating the familiar pipes and exposed radiators, and everything possible has been done to make engineering details as unobtrusive as possible in all parts of the building open to visitors.

The engineering plant and installations comprise steam boilers and their auxiliary appliances, generating sets, motor generators, switchboards, and other electrical apparatus, electric light and power systems, electric lifts, electric clocks, telephones, hot-water calorifiers, heating and ventilating plant, hot and cold water services, high-pressure water mains with hydrants and automatic sprinklers, vacuum cleaning plant and system of pipes, steam laundry machinery and apparatus, and an extensive installation of culinary plant.

The bulk of the work was executed by Messrs. Richard Crittall & Co., Ltd., of London; the electric light, power, and clock installations were entrusted to Messrs. Higgins & Griffiths, of London; and, as mentioned in our first article, the lifts were installed by the Otis Elevator Company, Ltd.

Boiler-house and Power Plant.

The steam boilers, electricity-generating machinery, calorifiers, and laundry machinery are situated in an independent building below ground level at the north side of the hotel, in order that the noise, vibration, and smell incidental to the operation of such plant shall not be communicated to the main building; but this department is readily accessible by means of connecting passages.

The boiler-house provides space for three water-tube boilers of the Stirling type, two of these having been laid down so far, each with the heating surface of 1,441 sq. ft. and capable of evaporating 7,000 lb. of steam per hour at the pressure of 160 lb. per square inch.

The boilers are fitted with automatic stokers of the Underfeed type, designed for using inexpensive fuel. Two electrically-driven fans provide the forced draught at a pressure of 2½ in. of water, and the products of combustion are conveyed from the boilers through a subterranean flue communicating with a steel chimney of 4 ft. 9 in. diameter carried above the roof of the hotel in one of the main ventilation shafts.

The Stirling boiler has upper steam and water drums connected to lower water drums by curved tubes placed transversely to the direction of the gases of combustion and situated favourably for dividing up the gases and abstracting heat from them. The boiler is completely surrounded by brickwork and suspended so as to provide for free expansion. The combustion-chamber is unusually large and fitted with baffles, causing the flames to pass up and down the various banks of tubes on their way to the main flue.

Coal-hoppers in connexion with the automatic stoking apparatus are fixed overhead in front of the boilers, at one side of which are feed pumps in duplicate, and near by the hot well and cast-iron pump for blowing-down purposes.

In the adjoining engine-room are three electricity-generating sets, each consisting of a three-throw quick revolution steam engine direct-coupled to a dynamo furnishing continuous current at 220 volts for lighting and power.

The whole of the exhaust steam from the engines and the various pumps can be utilised in the calorifiers for heating purposes and hot-water services, an automatic valve being provided so that the exhaust can escape direct to the atmosphere at times when there is a reduced demand for artificial heat and hot water.

An alternative arrangement makes it easy to supplement the exhaust steam by a supply of live steam from the boilers in case the former should be inadequate to provide sufficient heat at any time.

Calorifier and Pump-Room.

The heating and hot-water supply calorifiers are of the Royle type, with automatic regulating valves, and are arranged on the Crittall multiple series system.

Water circulating through the heating apparatus first passes through two calorifiers fitted with copper tube batteries connected with the exhaust steam main, and, providing a sufficient amount of steam is available, the water is there heated up to 150 deg. Fahr. It is next passed through another calorifier, also fitted with copper-tube battery, to which live steam is admitted as necessary by an automatic thermostatic valve.

This auxiliary battery comes into action whenever the supply of exhaust steam happens to be inadequate for raising the temperature of the water to the requisite limit of 150 deg. Fahr.

An electrically-driven pump is fitted in the main heating circuit to accelerate the circulation of water, this device having the effect of increasing the efficiency of the system and at the same time permitting the use of smaller pipes than would otherwise be requisite.

The hot-water supply calorifiers are similar to those for the heating system. Their heating capacity is equal to 5,000 gallons per hour, and to provide for the large quantities of water frequently drawn off by the simultaneous opening of numerous taps, these calorifiers are of the storage type, affording accommodation for 500 gallons of hot water as a reserve. The storage bodies, steam batteries, and circulation mains are of copper throughout.

In the calorifier-room is another electrically-driven pump, of the turbine type, capable of delivering 18,000 gallons of water per hour into the high-pressure fire mains against a vertical head of 180 ft. This pump is connected with the city water mains, and also with the cold-water storage tanks on the roof of the hotel, so that supplies of water shall be assured in the unlikely event of fire breaking out at any time when the city main may happen to be under repair.

The fire pump is fitted with an automatic device so arranged that immediately a hydrant valve is opened in any part of the hotel the pump is started, a bell is rung in the fireman's department, and a signal operates in the engineer's department.

Air Intakes and Conditioning Plant.

On the north side of the building is one of the two main air intakes for the warming and ventilation plant employed in the main apartments and terraces on the ground floor. Air is drawn in by way of a bricked well or area in the garden, the parapet of the well being screened by shrubs.

The incoming air is thoroughly washed, cleansed, and humidified in a "Carrier" air-conditioning plant, consisting of a galvanised-iron chamber, open at the inlet end and fitted with a special vertical screen at the outlet end. The bottom of the chamber is in the form of a shallow tank with ball valve overflow, and pipes are provided whence proceed numerous intersecting jets of water, forming a perfect water curtain through which the entering air must pass. Having been cleansed and humidified during its passage through the spray, the air enters the screen, which constitutes an efficient barrier to entrained particles of water.

In connexion with the air-conditioning plant are a hot-water battery and an electrically-driven fan.

A second plant of the same kind is installed on the opposite side of the hotel building.

The fans mentioned are of the multivane type, direct-coupled to powerful shunt-wound electric motors.

In cold weather the purified air is warmed by means of the hot-water batteries before entering the fans and passing thence into the main ducts. In warm weather the air is cooled before distribution.

Heating and Ventilation Systems.

The apparatus described forms part of the Crittall-balanced system of mechanical inlet and extraction ventilation which has been adopted for the French restaurant, grill-room, entrance hall, hypostyle hall, and the terraces around the fountain court.

From each fan a main duct conveys the purified and warmed, or cooled, air along the basement ceiling to the inlets in the various apartments.

At the base of each inlet is a relay heating battery, provided with an air valve, so arranged that all or any required proportion of the air can be passed over the battery before entering the apartment above. In this manner the temperature of the air can be regulated to a nicety, the valve also affording control over the volume of air admitted.

The warmed or cooled air is delivered into the rooms and other spaces by means of inlets designed as ornamental gratings, which harmonise with the general decorative treatment. Most of the gratings form part of the mouldings round arches and window-heads, and are quite unobtrusive. They possess the additional merit of distributing the incoming air in an effective manner without perceptible draught. Outlet gratings in the ceiling for vitiated air are placed at suitable points.

Air removed is conveyed through concealed ducts to two main ventilation shafts extending to the roof of the hotel, where each terminates at the casing of a powerful electrically-driven fan capable of moving 50,000 cubic ft. of air per minute.

The same fans deal with vitiated air from the kitchen department and service-rooms, the ducts being arranged so that the air from these parts of the building cannot gain admission to apartments used by visitors.

Apart from the absolute certainty of efficient ventilation ensured by this combination of the plenum and exhaust systems of mechanical ventilation, the system is distinctly worthy of notice by architects owing to the inconspicuous character of the air inlets and outlets.

All the rooms and corridors on the upper floors from the first to the fourth stories inclusive are warmed by Crittall's panel and floor border system of "invisible" heating.

The design of radiators has been greatly improved in recent years, and various methods have been introduced for casing radiators or heating pipes in an agreeable manner. For many classes of buildings one or other of these alternatives can be employed with general satisfaction, and for some buildings exposed radiators may be preferred for practical reasons.

In the case of private houses and residential buildings where well-diffused warmth is required continuously in cold weather without the visible presence of radiators, pipes, or open gratings, the system of invisible heating devised by Messrs. Crittall & Co. is certainly a thing to be desired. The warm panel absolutely conceals the heating pipes behind it, and the outer surface is finished in exactly the same style as the rest of the wall.

The warm floor border is similar in principle to the warm panel, and can be finished on the surface to match the flooring, or may be covered by carpet, linoleum, or any other material.

In the Adelphi Hotel a warm panel is placed under each window, and a narrow warm border is arranged along two sides of each room and near the walls of the corridors. The only visible indications of artificial warming apparatus are the handwheel of the valve controlling the supply of heat and a notice pointing out the position of the handwheel.

It may perhaps appear at first sight to some of our readers that the panel system cannot represent an efficient method of warming. The fact remains, however, that it is thoroughly satisfactory, and a little reflection will show that, apart from the heat radiated through the air and the heat communicated to the air by repeated contact with the warmed surfaces as the result of convection, the concealed pipes are placed so that they can most effectively perform the important duty of warming the materials of which the walls and floors are composed.

These parts of every building have always to be warmed, absorbing a very large proportion of the heat given off by heating apparatus of any kind, and until their temperature has been sufficiently raised the objects of the heating system can only be partially attained.

Therefore it will be seen that the principle of this panel system is theoretically correct, while in practice the panels and floor borders are found to diffuse a genial and well-distributed warmth, quite free from the oppressiveness perceptible in connexion with some methods of heating, and free from the unpleasant odour arising from the use of highly-heated pipes or radiators.

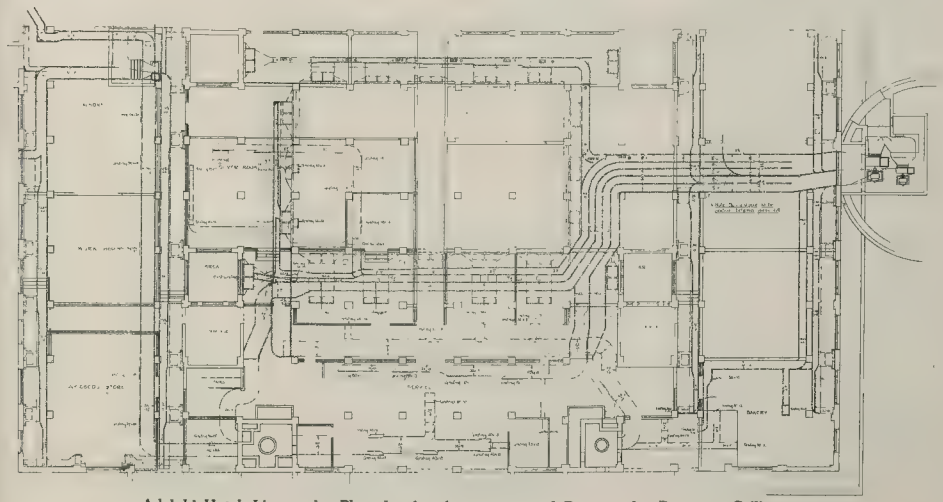
On the fifth and sixth floors of the hotel all the rooms are warmed by radiators, as the apartments in these two stories are of more simple character than those in the stories below them.

Hot and Cold Water Services and Fire Mains.

The hot and cold water services throughout the building were fitted by Messrs. Crittall & Co., and connected to the various sanitary fittings by Messrs. Davis, Bennett, & Co., as mentioned in our second article.

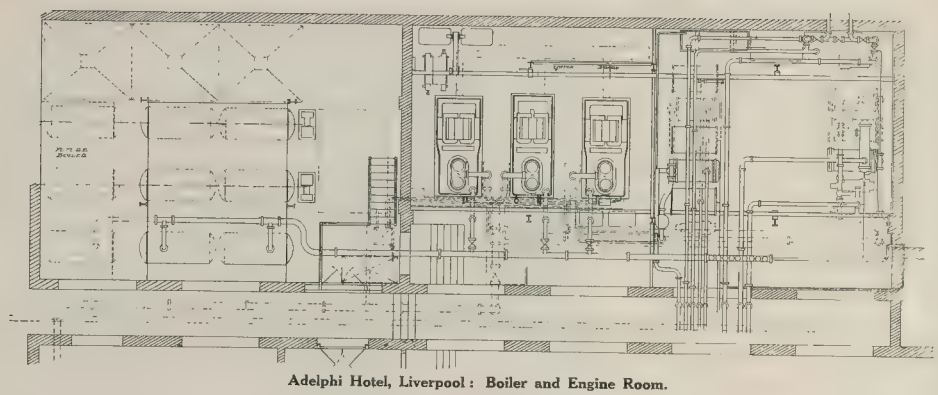
Cold water is stored in tanks situated in towers 15 ft. above roof level, the tanks being set back so that they will not be seen from the outside after the front portion of the hotel has been built. The tanks are of cast-iron, and have a storage capacity of about 10,000 gallons.

A service from the city main is laid on direct to the boiler-house, laundry, kitchen, and other parts of the lower floors, where large quantities of water are used, thereby reducing the necessity of pumping to a minimum.



The high-pressure hydrant mains are carried to all parts of the building, and are connected with automatic sprinklers fixed over the service lifts and in places where inflammable materials are stored.

Neatly-finished hydrant cupboards, each with plate-glass door, are provided and fixed near the corner of every corridor, and contain a gun-metal hydrant valve with Midland Railway pattern instantaneous coupling, two lengths of canvas hose, branch pipe, and three automatic fire extinguishers.



Vacuum-Cleaner Installation.

For the removal of dust from the hotel corridors and rooms a very complete installation of vacuum-cleaning plant has been provided. Rising mains are carried from the basement to the upper stories at numerous points, each riser being connected with a separate vacuum apparatus in order to permit a large number of rooms and corridors to be cleaned simultaneously. The service nozzles on the risers are fixed in the hydrant cupboards, the vacuum hose pipes being of length sufficient to command all the rooms situated between the various rising mains.

Dust entering the receiver of the vacuum plant is automatically mixed with water, and the resulting liquid flows into a detachable receptacle which is emptied at intervals. When inspecting the apparatus at work we asked why the outlet-pipe had not been connected with the drainage system of the hotel in order to obviate the periodical removal and emptying of the receptacles, and were informed that such connexions would be contrary to the regulations of the city authorities. In view of the fact that the discharge from the vacuum plant is quite liquid and contains less solid matter than street rain-water drains, and many domestic waste pipes, to say nothing of soil pipes, it is not easy to understand why the prohibition should exist. It may possibly have been framed some time ago to govern the disposal of trade wastes in Liverpool, but does not seem appropriate for application to vacuum-cleaner plant. While causing inconvenience to the occupants of buildings where the most approved method of cleaning has been adopted the regulation is probably quite inoperative in

Adelphi Hotel, Liverpool: Plan showing Arrangement of Ducts under Basement Ceiling.

Adelphi Hotel, Liverpool: Boiler and Engine Room.

other respects, inasmuch as there is little reason for doubting that the liquid discharge from vacuum apparatus usually finds its way into the drains after all.

Culinary Plant.

One of the most important installations in the hotel is that in the kitchen department. The kitchens are situated beneath the hypostyle hall and other apartments in its vicinity, and when the entire rebuilding project has been completed they will occupy a central position conducive to expeditious services to all parts of the building.

Large as the present kitchens are, they occupy only about two-thirds of the space that will be devoted to them after the front portion of the hotel has been reconstructed.

Consequently, the present kitchens may be regarded as being temporary in a sense. The apparatus has been laid down as far as possible to occupy the positions that will finally be allotted to them, but in cases where this proved impracticable the units were fixed in such manner as to permit them to be readily transferred to new positions.

A striking feature of the present equipment is a central independent range, 22 ft. long by 6 ft. 6 in. wide, with plate and casserole racks over the hot plate.

The range has six fires arranged on the Fourneau system, with a descending flue which passes beneath the floor to the chimney-shaft. It contains ten cooking-ovens and a double temperate oven or hot closet. The sides of the cooking-ovens are fitted with sliding radiancy screens permitting the contents of the ovens to be exposed to the full radiant heat from the firepots if desired.

The other apparatus comprises double coke grills, with hot closets above the fire, steam ovens for vegetables, puddings, and fish, fitted with capstan bolting device by which the doors can be hermetically sealed with one hand, steam-heated *bain maries* for sauce-making, gas-heated salamanders and stockpot stoves, steam-heated service tables in the kitchen and service-rooms, steam-heated pot-washing tanks and gas boiling tables and hot closets in the pastry-room.

The continuous water-boilers in the two still-rooms are fitted with automatic mercury controlling device. The boilers are arranged so that it is impossible for water to be drawn off until it has reached the boiling-point, and to prevent the water from becoming stale as the result of over-boiling the automatic control shuts off the gas immediately after fresh supplies of water have been brought to the boiling-point, the gas being automatically turned on whenever hot water is drawn off and replaced by cold water.

In the bakery are a brick-built oven for making Viennese bread and a Perkins steam tube oven for ordinary bread. These two ovens are capable of supplying the whole of the bread and rolls required in the hotel as well as a supplementary supply for restaurant cars on the railway if required.

The sinks for washing plates, cutlery, and silver are of teak throughout and arranged on the Staines system, the distinguishing feature of which is a series of weirs carrying away the surface water continuously during the process of washing up. Thus greasy matter floating on the surface are led away to the drains, keeping the water in the sinks free from grease, economising water and labour, and conducing to the better appearance of the articles cleansed.

Spacious refrigerator chambers, worked on the carbon dioxide principle, have been installed in the cold larder and wine service-rooms for the storage of meat and wines.

For the conveyance of messages from the kitchen to the larders and auxiliary offices generally a complete system of speaking tubes with megaphone attachments has been provided, while for the transmission of written orders from the service-rooms all over the hotel a system of brass gravity tubes has been installed. These tubes terminate in the kitchen in a position convenient for the clerical staff. An automatic ringing device and electrical indicator is operated immediately on the arrival of a message-carrier at its destination.

Considering its underground situation, the kitchen department of the hotel is wonderfully well lighted, a point for which the architect deserves credit.

Laundry Machinery and Plant.

In order to provide for the expeditious washing, ironing, and mending of visitors' and house linen, the hotel management have fitted a complete steam laundry in the vicinity of the power-house.

Owing to the limited space available, it was important to utilise every square foot to the greatest possible advantage by installing machinery giving a maximum output for a minimum amount of floor space, and by setting out the machinery and appliances so as to obviate wasted room.

After completion of the front portion of the building, the linen sorting and ironing rooms will be extended and a linen mending department will be added.

The whole of the machinery is electrically driven by means of current from the hotel generating plant, some of the machines being driven by means of belting and others direct from motors.

In the wash-house are two rotary washing-machines with the capacity of 350 shirts each, two 48-in. hydro-extractors of the under-driven type, and various accessories. The wastes from the machinery and apparatus are taken into white glazed fireclay channels covered with galvanised gratings laid in rebates.

Between the wash-house and ironing-room are two drying chambers with white glazed brick walls. Articles to be dried are suspended on overhead fixed rails, and are subjected to a blast of air blown through the room from a fan and steam-heater. The rooms are arranged so that one is in use while the other is being filled or emptied. An ingenious arrangement between the two doors provides for the admission of heated air into either room, but not into both rooms at the same time, and when either door is open the operating mechanism cannot be used, thus making it impossible for any thoughtless person to turn on the hot air while the chamber is in course of being charged or emptied.

Two Decoudun ironing-machines in the next room are capable of dealing with tablecloths, sheets, or other pieces of fabric of any length and up to 110 in. wide without folding, and in a second ironing-room an electrically-driven shirt-front ironer and a series of gas-irons are installed.

The department is completed by a large airing-room, with racks and steam coils, and a clean linen sorting-room.

Electric Light Installation.

The electric light and power installations were entrusted to Messrs. Higgins & Griffiths, of London, all the wiring being on the conduit system, and the bedroom switches designed to be flush with the panelling of the dressing-table, washstand, and wardrobe fixtures.

Osram metallic filament incandescent lamps are used throughout the hotel. These and most of the electroliers and lamp fittings have been manufactured by the General Electric Company, Ltd., of London.

All the electric light fittings were made in accordance with designs supplied by the architect. They comprise several massive electroliers in the hypostyle hall and terrace by Messrs. Singer & Sons, of Frome; fourteen sixteen-light cut crystal and ormolu electroliers in the entrance hall and French restaurant, fourteen eight-light neo-Greek electroliers in the grill-room, chased ormolu standards for dining tables, and a large number of smaller fittings, brackets, and pendants for staircases, corridors, and rooms, all these having been supplied by the General Electric Company.

Electric Clocks.

One specially ingenious application of electricity in the new building is represented by the installation of some two hundred electric clocks in the principal rooms, bedrooms, service-rooms, servants' quarters, and elsewhere. All the clocks keep uniform and accurate time, and are operated by one main controlling pendulum.

The dials are of the "Synchronome" impulse type, and with the exception of those in the staff departments are of Parisian enamel on copper. They were made by Messrs. Henri Picard & Freres, of Paris, and set in handsome brass cases, finished by hand by Messrs. Veritys, Ltd., of Birmingham, to the architect's design.

In view of the need for providing silently working clocks in bedrooms the manager of the Midlands Hotels Department had electric clocks of four different makes fitted in some of the rooms at the St. Pancras and Derby hotels, where they were carefully tested. Although none of these was absolutely silent, the "Synchronome" type was found to be the most satisfactory.

The dials are connected with the main controlling apparatus by wiring circuits arranged in loops around the different floors, the ends being attached to a switchboard with devices for enabling any fault to be located without difficulty or delay.

The dials were supplied by the Synchronome Company, Ltd., of London, and installed by the electrical contractors

DORKING PARISH CHURCH.

A faculty has been applied for to enlarge the side chapel of the Parish Church of Dorking. Plans have been prepared by Mr. Amian L. Champneys, son of Mr. Basil Champneys.

MURAL DECORATION.

ON Tuesday evening, at the invitation of the Society of Painters in Tempera, a meeting of those interested in mural decoration was held at Crosby Hall, Chelsea, by permission of the Mural Exhibition Committee.

Sir Charles Holroyd,
who presided, welcomed such a large attendance, and expressed the hope that the exhibition was the beginning of a movement to enable them after some 200 years to produce something like mural decoration in England. They must not be cast down if they did not get a fine style in ten years, because they could only learn by experience. Nothing that had been done so far could really help them, but they had to find their own way of doing things, helped by the examples that had gone before them. Men coming from the art schools thoroughly trained should be made to decorate the many suitable buildings which they had in England. There were schools, in the first place, for young men to try their hands upon, and there were great buildings like the new County Council Hall, which was sure to have large waste spaces. Then there were the municipal offices and, above all, beautiful private houses with suitable places for decoration, which should be done for the space in which it was to be seen. Pictures were painted for the gallery, and he had often been disappointed when seeing them afterwards in private houses. By mural decoration people would be able to decorate their walls suitably. In the dark places they could make the paint sing a tune which would carry through that darkness, and in light places they could play more quietly and make the thing recede properly from the wall, and not, as pictures often appeared to do, to jump at one and stand out. By mural decoration he meant all methods of painting which had been invented. Even the despised oil painting served suitably for mural decoration. But fresco seemed to be the right method, and he believed that pure fresco would exist for a long time on the interior walls of cloisters of England.

Professor Selwyn Image
said the movement which had been initiated was a plain and forcible sign that what Matthew Arnold used to call the social idea was spreading amongst them in the matter of art as in other interests of life. He considered that in the past few years there had been too much pure consideration of picture painting as the highest form of art, but art was not a thing merely of private possession. It was a thing for the whole community, and the more they could spread it through the community the better for the community and the better for the art. He understood that the movement was raising enthusiasm and that there were many who were willing to put wall spaces at the disposal of artists and students for the purposes of decoration. They must remember, however, that the movement for a considerable time must remain in the nature of an experiment, and there would no doubt be a good many failures. He urged students, therefore, to put the highest ideals before them and strive to attain them, and he asked the critics to be generous. Students who had the opportunity of decorating a wall space should take up the work with the greatest seriousness, and in the subjects they chose and in the treatment of those subjects they should avoid extravagance and try to produce the finest work of which they were capable. They should think of the beautiful decoration which had been done in England in the old days by the simplest methods. The speaker discussed the decoration of schools and suggested they should not be too much influenced by the wishes of teachers and children. With regard to the opportunities for the decoration of wall spaces, he did not think students should be allowed to fly off like pigeons and alight on wall spaces. There were many accomplished artists capable of carrying out good design, and he thought these men should gather pupils around them to assist, but be themselves responsible for the design. In conclusion he suggested that the students who did the work should be adequately remunerated.

Mr. Walter Crane
said the last speaker had pointed out the lions in the path, but they wanted a little more audacity. They wanted to take their courage in both hands and go ahead. The suggestion with regard to the movement was that unsatisfactory works should be whitewashed over, and so students could go straight away feeling that they would not be a public annoyance. They spent public money in teaching decorators, and they ought to be able to find some work for them. He agreed that they did not want cheap labour, but the mural decorator could not expect the monetary reward as in the case of the painter of the easel picture which, owing to the tendency of the age, was made the subject of speculation. A picture in a room was a work of art not connected with the room itself, but mural decoration was not so. He agreed as to an artist being responsible for a design and calling in the assistance of pupils, as in the case of the old Italians, but at the same time he was not averse to free experiment on the part of the student, as it was the only way one could learn to do one's work. He considered the great appropriate subjects of mural decoration were of the more permanent symbolic kind, such as the ideas of Justice and Freedom and the great overshadowing figures of Fate and Time and Death.

Mr. J. E. Southall (Birmingham)
remarked that it might be objected that in the case of mural decoration there might very well be no future at all. They saw the new buildings of to-day being constructed of iron posts and girders with hardly anything worthy of the name of a wall in their composition. If in the future there were to be no walls, what was to become of mural decoration? Still, there was the incalculable force of instinct to be considered. Of all the doings of men through all the ages, the pictorial decoration of walls was the oldest, and the instinct which prompted their remotest ancestors to engrave and paint the sides of their caves would not be extirpated in a generation or two, and the time would surely come when they would find it both necessary and delightful to build good solid walls. English people made expensive journeys to see the mural decorations of Italy, but it never entered their minds to spend money on the decorations of the public buildings in this country. If only a small portion of the money spent on presentation portraits could be diverted to presentation frescoes, he believed the British public would begin to discover a new source of pleasure, while the relatives of those now being portrayed would experience a quite inexpressible sense of relief. Discussing the experiments made on the walls of the House of Lords, the speaker said the cause of the decay lay rather with the mistakes of the painters than in any inherent weakness in the process when rightly carried out, and he thought a careful weighing of the evidence did not justify them in saying that the atmosphere of London was fatal to true fresco indoors. If, however, this highest form of art was to flourish, it must be in a community with a lively sense of the common weal as its chief joy. Mr. Southall urged the necessity of there not being early failures in the movement through want of care or judgment on the part of the artists, and pointed out, amongst other things, the danger of concentrating attention upon aerial perspective and light and shade. If an architect lent them a wall they had no right to take it away and leave only a gap, however interesting the perspective seen through the gap. Light and shade were rather the special province of the sculptor, and the best frescoes told as masses of lovely colour. If they observed a proper regard for architecture, they might appeal to architects to give more consideration to painters and sculptors. If some of their architects would exercise more restraint and be a little more severe in style some of the money saved might go towards producing real live mural decoration.

Mr. A. J. Penty,
speaking from the point of view of the architect, said it seemed to him in the past there was some great impersonal force in society around which artists centred. In the Middle Ages the expression of art always centred round the Christian ideal. The difficulty in the revival of fresco at the present day was that they had no great subjects. He suggested that what they wanted was what he would term an artistic philosophy. They needed to fix their view on some particular period of the past, and he suggested the best would be that of Giotto and Cimabue. If they attempted to revive that period they could not do so, but the attempt would have a co-ordinating effect, and it would tend to promote a unity of method amongst those practising mural decoration.

The Chairman
agreed that if a style was to be chosen they should follow Giotto, for his frescoes were better than anybody's. The first great men who took up a method did all it could do. Rembrandt took up etching, and they all followed after, but it was all Rembrandt.

Mr. J. D. Crace
pointed out that in the finest period of Italian fresco work none of the artists thought it necessary to make their designs in quaint and archaic fashion. It seemed to be the impression amongst some of the artists in the exhibition that they should be stiff and archaic in the character of the figures or in the arrangement of the colouring. The great decorators of the past studied simplicity of design, and their designs were conceived in what might be called a diffused light. Above all, they never left their pictures unallied to the wall. Unless they blended their work into the building it was not decoration.

Mr. Halsey Ricardo urged that trained students did not get a chance. He agreed that the mural decoration of old times involved a general scheme in which a number of painters took part.

Mr. R. Hallward
expressed himself as amazed at the suggestion that artists should be left out and students introduced to do this work. The movement had begun upside down. It was suggested that students should do work which might be whitewashed over in a few years if it did not suit certain people, but would any self-respecting artist work on these terms? He considered there was a chance of great harm being done by the movement, and when they were told that the thing must be done this way or that way he heard the gods laugh.

Mr. Noel Heaton
said the failure of the House of Lords' frescoes made people believe that the climate of this country was not suitable for such work, but these and other failures were owing to the lack of sufficient technical knowledge on the part of the artists. Those who worked to gratify themselves as mural decorators should not think themselves above studying the composition of new grounds and their pigments and so forth.

It was announced that the exhibition will remain open till June 29, and that by request the loan portion will be sent to the Manchester Art Gallery after that date.

THE LONDON COUNTY COUNCIL.

THE first weekly meeting after the Whitsun recess of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Lord Cheylesmore, Chairman, presiding.

The Chief Engineer.—Sir Maurice Fitzmaurice, C.M.G., has resigned his position as Chief Engineer to the Council, which position he has held since 1902. His resignation will take effect from December, when Sir Maurice intends to start a private practice.

Loans.—The Finance Committee recommended that loans be made to Borough Councils as follows:—Battersea, 1,980*l.* for drainage and kerbing; Hackney, 6,500*l.* for electricity undertaking; Poplar, 1,860*l.* for pipe sewer works; and the North Surrey School District Managers, 1,467*l.* for Poor Law purposes.

New County Hall.—In a report of the Establishment Committee it was stated that section A (central) and section C (north) of the superstructure of the new County Hall would be finished in 1915, and section B (south) in 1916.

Slum Area.—On a report of the Housing of the Working Classes Committee an amendment was moved by Mr. P. Harris that it should be referred to the Finance Committee to consider a report as to the submission of an estimate for the clearance of Brady-street, Bethnal Green, slum area, so that a scheme might be put in hand without delay. Sir A. Griffith-Boscawen pointed out that before the area referred to could be dealt with it would be necessary to formulate a scheme to carry it through the Council and to have an inquiry before the Local Government Board. It would, therefore, be impossible to spend any money on the area this year, and there was no necessity to increase the estimates. The amendment was rejected by fifty-eight votes to forty-eight.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xx.; Auction Sales, xxvi. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Competitions.

JUNE 24.—**Reigate.**—CORPORATION FARMHOUSE.—Not to exceed 550*l.* Local architects only. Premium 10*l.* 10s. Particulars from the Town Clerk, Reigate.

JUNE 24. — **Wales.** — TWO SANATORIA. — The Executive Committee of the King Edward VII. Welsh National Memorial invite architects to submit sketches for two sanatoria, one in North and the other in South Wales. Accommodation, 150 and 250 beds respectively. See advertisement in the issue of May 31 for further particulars.

JUNE 26.—**Birmingham.**—BATHS.—Twenty and 10 guineas for second and third designs. Applications for conditions to be sent to the Superintendent Engineer, Kent-street, Birmingham.

JUNE 28. — **Hale, Cheshire.**—TOWN-PLANNING SCHEME.—Premiums 50*l.* and 25*l.* Particulars from the Council Offices, Hale. See issue of May 24 (page 601).

* JUNE 28.—**Regent's Quadrant.**—DESIGN FOR TREATMENT.—Premiums, 25 guineas, and 25 guineas divided. Adjudicators, Mr. W. Flockhart, Mr. E. A. Rickards, and Mr. Alan E. Munby. See advertisement in this issue for further particulars; also "Competition News," issue of April 19 (page 453), May 3 (page 512), May 10 (page 537).

JUNE 29.—**Reigate.**—LAYING-OUT AND DEVELOPING REIGATE LODGE ESTATE.—Premiums 30 guineas and 10 guineas. Particulars from the Town Clerk, Reigate.

JUNE 30.—**Padiham.**—TOWN HALL, BATHS ETC. —Premiums 40*l.* and 20*l.* Particulars from Mr. J. Gregson, A.M.Inst.C.E., Surveyor's Office, Padiham.

JULY 1. — **Dusseldorf.** — A plan for the extension of the City of Dusseldorf. Premiums of 1,000*l.* to 375*l.* Conditions on application to the Chief Burgomaster, Dusseldorf. A translation appeared on page 365, September 28.

JULY 1.—**Port of London.**—NEW OFFICES.—Limited to those mentioned in "Competition News," issue of April 12 (page 424).

JULY 5. — **Conisbrough.** — ADDITIONS TO HOSPITAL.—The Doncaster and Mexbrough Joint Hospital Board invite competitive plans for additions to Isolation Hospital. See advertisements in the issues of May 17 and June 7 for further particulars.

AUGUST 6. — **Cardiff.** — FIRE-STATION. — The Cardiff Corporation invite designs and estimates for a fire brigade station in Westgate-street. Mr A. Marshall Mackenzie, assessor. Particulars from the Town Clerk, City Hall, Cardiff.

AUGUST 30. — SAXON SNELL PRIZE. — Fifty guineas, with medal, is offered for essay on "The Lighting, Heating, etc., of an Operating-Room for a General Hospital." Particulars from the Sanitary Institute, 90, Buckingham Palace-road, S.W.

SEPTEMBER 1.—**Goole.**—MUNICIPAL OFFICES.—Premiums 30*l.* and 15*l.* Particulars from Mr. R. Tyson, Council Offices, Goole.

SEPTEMBER 30.—**Dublin.**—UNIVERSITY COLLEGE: NEW BUILDINGS.—Limited to architects in Ireland. Assessor, Mr. H. T. Hare, F.R.I.B.A.

OCTOBER 1. — **Ottawa.** — MONUMENT TO KING EDWARD VII.—Sketch models in plaster to be sent to the Director of National Art Gallery, Ottawa.

NO DATE.—**Jordanhill, Glasgow.**—PROPOSED TRAINING COLLEGE.—Limited to six firms, named in "Competition News," December 1, page 635.

NO DATE. — **Warrington.** — SCHOOL. — The Warrington Education Committee invite competitive plans for the erection of a public elementary school. See advertisement in issue of February 16 for further particulars.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

JUNE 21.—**Abergavenny.**—HOUSES.—For erection of a pair of houses in Wyndham-road, Abergavenny. Plans, specification, and particulars from Mr. B. J. Francis, architect, Abergavenny.

JUNE 21.—**Poole.**—SCHOOL.—Erection of an infants' elementary school at Courthill-road. Plans, specification, and conditions seen, and quantities, with forms of tender, on deposit of 5*l.*, with Mr. Samuel J. Newman, F.R.I.B.A., Borough Surveyor, Municipal-buildings, Market-street, Poole.

JUNE 22. **Armagh.** REPAIRS, ETC.—For carrying out structural repairs, painting, etc., to the savings bank premises, Armagh. Specification with Mr. H. C. Parkinson, architect, Russell-street, Armagh.

JUNE 22. — **Bradford.** — ALTERATIONS. — For alterations at the Technical College. Drawings and general conditions of contract seen, and quantities and form of tender from the City Architect, Town Hall, Bradford

JUNE 22. — **Halstead.**—REPAIRS.—For improvements and repairs to the Stumner Council School. Plan and specification by Mr. F. Whitmore, County Architect, 54, Head-street, Halstead.

JUNE 22. — **Halstead.** — REPAIRS, ETC.—For repairs and painting to the Castle Hedingham Council School. Specification prepared by Mr. F. Whitmore, County Architect, 54, Head-street, Halstead.

JUNE 22. —**Teemore.** HALL.—For building of a Temperance Hall at Teemore, Belturbet. Plan and specification by Mr. J. J. Bergin, C.E., A.S.G., Cavan. Mr. P. Clarke, Secretary to Building Committee, Drumanymore, Belturbet.

JUNE 24. — **Castlereggy.** — ALTERATIONS, ETC.—For alterations and improvements to dwelling-house at Castlereggy, Ballinamore, Co. Leitrim Plans and specifications with Mr. P. J. Brady, C.E., architect, Broomfield House, Ballyhaise.

JUNE 24. — **Ely.** — NURSERY.—Erection of a nursery for infants at Headquarters Homes, Ely. Plans and specifications by architect, Mr. Edwin Seward, F.R.I.B.A., Queen's-chambers, Cardiff. Quantities on deposit of 2*l.* 2s.

JUNE 24. — **Ely.** — WALLS, ETC.—Erection of boundary walls and gateway around land at Ely. Plans and specifications with architect, Mr. Edwin Seward, F.R.I.B.A., Queen's-chambers, Cardiff.

JUNE 24.—**Haworth.**—ALTERATIONS.—For small alterations to Hillside House, Haworth. Drawings seen, and quantities from Messrs. Moore & Crabtree, architects, Town Hall-square, Keighley.

JUNE 24. — **Hingham.** — COTTAGES. For three pairs of cottages at Hingham, Norfolk. Plans and specification with the architects, Messrs. A F. Scott & Son, 24, Castle-meadow, Norwich, and 12, Holborn-hall, London, W.C.

JUNE 24. — **Holmfirth.** — HOUSES.—Erection of six dwelling-houses, Workhouse Farm, Holmfirth. Plans seen, and quantities from Messrs. Lunn & Kaye, architects and surveyors, Milnsbridge, and 14, John William-street, Huddersfield.

JUNE 24. — **Huddersfield.** — ADDITIONS.—For erection of additions and alterations to the restaurant, Buxton-road, for the Huddersfield Industrial Society, Ltd. Plans seen, and quantities from Messrs. J. Berry & Sons, architects and surveyors, 3, Market-place, Huddersfield.

JUNE 24.—**Leadgate.**—SHOPS, ETC.—For building business premises at Chopwell, for the Leadgate Industrial and Provident Society, Ltd. Plans and specifications at the general offices of the Society at Leadgate, Durham.

JUNE 24. — **Leeds.**—TANKS, ETC.—Construction of concrete tanks, water ways, weirs, etc., involving the construction of a temporary coffer dam, at the Generating Station, 1, Whitehall-road, Leeds. Form of agreement, specification, and form of tender from Mr H. Dickinson, Manager, 1, Whitehall-road, Leeds.

JUNE 24. — **Tonyrefail.**—HOUSES.—Erection of twenty-four dwelling-houses for the Penygaeg Building Club. Plans and specification with Messrs. Arthur Ll. Thomas & Gomer S. Morgan, architects and surveyors, Pontypridd.

JUNE 25. — **Cavan.** — ENLARGEMENT.—The Committee of the Killeshandra Co-operative Society, Ltd., Co. Cavan, is prepared to receive tenders for the rebuilding and enlarging of their offices and stores. Plan and specification at the office of the Society, Killeshandra.

JUNE 25. — **London.** — ALTERATIONS, ETC.—For alterations and external painting at Relief Station, Elder-road, West Norwood, S.E. Forms of tender from Mr. James L. Goldspink, Clerk to the Guardians, Guardians' Offices and Board-room, Brook-street, Kennington-road, S.E. Deposit of 2*l.* 2s.

JUNE 25. — **London.** — ADDITIONS, ETC.—For carrying out alterations and additions at the Queen's-road and Blackhorse-road Schools, Walthamstow. Plans and specifications seen, and forms of tender from Mr. H. Prosser, M.S.A., Architect to the Committee, Education Committee Offices, High-street, Walthamstow, N.E.

JUNE 25. — **Londonderry.**—HOUSES.—Erection of two almshouses in Bridge-street, Londonderry. Plans and specifications with Mr. John M. Robinson, architect, 7, Market-buildings, Strand, Londonderry.

JUNE 25.—**Manchester.**—CONVENIENCES.—Erection of conveniences, etc., at Lower Crumpsall Recreation Ground and at the Bowl House, Plymouth Grove Recreation Ground. Drawings seen, and specification from the City Architect, Town Hall, on deposit of 10s. 6d.

JUNE 25.—**Manchester.**—CONVENIENCES.—For the construction of public conveniences at Gorton Town Hall. Specification and quantities from the City Architect, Town Hall, on deposit of 1*l.* 1s.

JUNE 26.—**Aspatria.**—HOUSE.—For the erection of a dwelling-house, etc., at Outgang-road. Plans and specifications with Mr. J. Berwick, 17, Pringle, Aspatria.

JUNE 26. — **Edmonton.**—REPAIRS.—For repairs and painting works, etc., to the concert hall, staircases, entrance hall, at the Town Hall, Edmonton. Particulars and forms of tender from the Architect of the Council, Mr. H. W. Dobb, Town Hall, Edmonton.

JUNE 26. — **Knockbain.**—ADDITIONS, ETC.—For additions and alterations to Knockbain School-house. Plans and specifications seen, and quantities from Mr. Thos. Munro, architect, 62, Academy-street, Inverness.

JUNE 26.—**Neston.** REPAIRS.—For repairs and alterations at property in Brook-street, Neston. Specification and tender from the Surveyor, Town Hall, Neston.

LONDON COUNCILS.

Bermondsey.—Plans lodged by Mr. W. G. R. Sprague, architect, Criterion-chambers, Jermyn-street, W., have been approved for the erection of a cinematograph hall on the site of No. 57, Lower road, Rotherhithe.

Croydon.—Various alterations and improvements are to be carried out at South Norwood School at a cost not to exceed 1,060*l.* Mr. H. Carter Pegg has been appointed architect for the enlargement on the Ecclesbourne-road Schools at a remuneration of 4 per cent. of the contract price. The tenders of Messrs. W. Smith & Sons and Messrs. G. E. Everitt & Sons, both of Croydon, have been accepted at 14,493*l.* and 920*l.* for the erection of the Borough School and a handicraft centre at Boston-road School, respectively.

Friern Barnet.—Plans have been passed for Mr. H. E. Stacey to erect eighteen houses in Athenæum-road and Oakleigh-gardens.

Hemel Hempstead.—Mr. H. G. Darer has had plans passed permitting him to erect a cinematograph hall in London-road.

Marylebone.—A portion of the carriageway of Wellington-road is to be recoated and tar-sprayed at an estimated cost of 210*l.* Plans have been lodged with the London County Council by Messrs. Boehmer & Gibbs for the erection of an hotel on the site of No. 152, Oxford-street. Messrs. Gale, Durlacher, & Emmett, 15, New Bridge-street, E.C., have also lodged plans with the Central Authority for the erection of a cinematograph theatre in Marylebone-road.

Richmond.—The tender of Messrs. R. Clayden, Ltd., Richmond, at 283*l.* 7s. 9d., has been accepted for certain repair works to the Council's workmen's dwellings.

Stepney.—Electricity mains are to be extended in two streets. The General Purposes Committee have decided to proceed with the work of erecting a bacteriological laboratory at the Public Health Offices, for which tenders will be invited, subject to the usual sanction.

Wimbledon.—The Town-Planning Committee have instructed the Borough Surveyor to prepare plans showing lands available for building in the Borough not yet built upon. Plans have been passed for Mr. R. C. T. Gordon for the erection of twenty houses in Ravensbury and Acuba roads.

OBITUARY.

Mr. H. J. Williams.

The death, on June 7, at his residence, Eagle House, Brislington, is announced of Mr. Henry Joseph Williams, of Alliance chambers, Corn-street, Bristol, in his seventy-first year. Mr. Williams had an extensive practice in Bristol, his native city, where he began his career as an architect more than forty years ago. He was one of the fourteen architects who were invited twelve years since to submit designs for the new Bristol Infirmary, for 1,000 patients; he was employed in the repair and resoration of several churches, comprising, as we gather, the underpinning of the north side of Ripon Cathedral. Of his other work in the locality we may mention the Law Union and Crown Insurance offices in Clare-street (1897); Avonbank electricity works in Feeder-road (1900-1); Petty Sessional and police courts, Nelson and Bridewell streets, rebuilding and extension (1901-2), in competition; the new Stock Exchange, with offices and library, in Nicholas-street; and the Waterworks Company's offices in Telephone-avenue (1902-3); Council School, Parson-street, Bedminster, for 1,050 scholars; the Bristol Wagon and Carriage Works Company's workshops and garage in Victoria-street; London and South-Western Bank, and the branches of Lloyd's Banking Company; offices for the *Western Daily Express* in Baldwin-street; and business premises in Wine-street and the Pithay for Messrs. Harris & Sons, in Broad-street for Mr. E. Everard, in Avondale-road for Messrs. Chappell, Allen, & Co., in Temple-gate for Messrs. Todd & Co., in Rupert-street for Mr. C. Wills, in Victoria-street for Messrs. Bolt, with several other factories, warehouses, etc.

Mr. F. Ingle.

We regret to learn that Mr. Frederick Ingle, of the firm of Messrs. Dennett & Ingle, patentees of the Dennett fireproof construction, died on May 30. He was seventy-three years of age. In his early life, before joining Messrs. Robert Dennett & Co., Mr. Ingle was associated with the late Mr. T. C. Hine, F.S.A., of Nottingham.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not

"Ideal" Registers & Ventilators.

"Ideal" Registers combine superior design and finish with strength and durability—they are made of cast-iron, therefore do not rust and can be fixed in any situation—are available in a great variety of sizes—can be promptly supplied in any colour or finish.

"Ideal" Plain Lattice Design Register.

Cast-iron Wall Frames are specially designed to hold Registers securely in position, are inexpensive, and can be masoned solidly into brickwork.

A large stock of nearly all sizes of Plain Lattice Black Japanned Registers is regularly carried at our Hull works.

Full particulars, illustrations, and prices on request.

We make "Ideal" Radiators and "Ideal" Boilers, and supply all Accessories required in connection with Low Pressure Hot Water and Steam Heating.

POINTS OF MERIT:

Favourable Situation.

Immingham Dock is geographically the most central coal port for the Continent, and is in direct rail communication with the great coalfields of the West Riding and South Yorkshire, Derbyshire, Nottinghamshire, &c.

Always Accessible.

Immingham Dock has a storm-protected harbour and deep water channel and entrance lock, enabling the largest ships to enter and leave at any state of the tide.

Most Modern Equipment.

Immingham Dock has eight coal hoists capable of shipping 5,600 tons per hour.
Largest ships can bunker at deep water jetty—only ten miles from the open sea—at any time of the day or night.
Storage accommodation is provided for 11,600 loaded wagons, and there are 170 miles of sidings.
Every precaution taken to minimise breakage of coal.
Movable hoist enables two "holds" of a vessel to be loaded simultaneously.

Low Dock Charges.

Immingham Dock charges are more favourable than at any competitive port.

For Information apply Great Central Goods Agents or Port Master, Immingham Dock, Grimsby. Illustrated Brochure "3" and Map "3," printed in English, French or German, post free from G.C.R. Publicity Office, 216, Marylebone Road, London, N.W.

Mr. Basil Champneys, Architect.

EDUCATION AND STYLE IN ARCHITECTURE.

THE education of architects is, at the present time, a subject of such general and vital interest that we need no excuse for reverting to it. We hope, indeed, to publish soon a short series of articles dealing with what has already been accomplished in this matter of architectural education in the British Universities and discussing the possibilities of the future. As a prelude to the consideration of the work of any particular school it would be well to deal with the subject first from a somewhat fundamental point of view.

The controversy between traditional and modern aims and methods in education, between those who put character and individuality and those who put efficiency as its primary end and ideal, is of special interest to those whose art is pre-eminently concerned with both use and beauty.

No doubt the end of education is character; but that is not to say that efficiency is a secondary aim, or that it was made so in the older or traditional methods and ideals. If separation is to be made, it was rather that efficiency came first in order of consciousness. While men aimed at efficiency in pursuit of their occupations—hunting, fighting, shepherding, ploughing, trade, the handicrafts or arts—character and individuality developed silently and unconsciously. Not in the cloister alone, whether of University or still older Abbey, but also in the towns, the fields, and on the high seas, were wrought out those qualities of character that built up England. Probably it is through this very separation and contrast of aim, in its varying phases—religious *v.* secular, classical *v.* modern, cultural *v.* utilitarian and commercial—that we miss any satisfactory national system of education, and fail, as we do, in the development of qualities—such as spontaneous activity, creative impulse and energy, imagination and social and æsthetic interest—without which efficiency is a mere matter of mechanical accuracy, and character and individuality a light under a bushel, a buried talent, or maybe a mere semblance and sham. It is not that efficiency as a primary aim is wrong, but that the aim is faulty, the mark ill-defined.

Who, for instance, would dispute that efficiency is an aim in architecture of the very first importance? And not technical and building efficiency only, but

that also which serves, and expresses, the purpose and function of buildings; that fitness, in short, which is so essential to beauty, individuality, style.

With regard to style, there is no need to prolong the echoes of old battles, or even to dispute with Mr. R. A. Cram, the author of a virile paper, whether or no, or how far, modern architects should aim "to recreate from antiquity the beauty that is primarily educational," till the new civilisation, in full tide, shall burst the "archæological shell" and bring forth its new style fully fledged. But it would seem there is need to ask whether the patient, loving, and sincere study of the beautiful work of ancient and mediæval times has not too much left out of account one of its chief lessons—that style arises, not as an ideal preconceived, but as one growing into consciousness and perfection as men strove, with the means and under the various interacting conditions of their environment, to meet, with practical efficiency, their requirements and give expression to desires and aspirations that animated them. It is thus easy to understand the failure of revivals to develop, and why they can give no more than a semblance of character to modern architecture, veiling the true one, and often even the constructive forms it should express.

Study of the "archæological shells" of the past is necessary, but not less so of the living organism of the present. Fascinated by the beauty of the former, architectural education has not sufficiently emphasised that to the growth of living style the other factor is requisite also. In the result, modern English architecture, failing to carry on its splendid traditions of the past, either of its more native Gothic or its own peculiar appropriation of the Southern Renaissance, fails also to evolve a new one; but fits to its distinctive modern plans, and forms and methods of construction, the cold mask of *soi-disant* revival or Renaissance, sometimes intrinsically beautiful, academically logical, archæologically correct, but, for the most part, still-born, soulless; expressive of little or nothing save perhaps a grandiose importance, real or assumed, or the desire or possession of wealth. It is not only, nor mainly, the fault of the architects. Probably every age must express itself in the forms it deserves. Yet whatever truth may be in the common apology, that an age of mechanical utilitarianism and commercialism has no call nor inspiration to artistic expression, it savours somewhat of feebleness. As if architecture had nothing to do with utilities! As if there were no good even in machinery, or in commerce and industry; no problems, structural and æsthetic; no ideals, social, industrial, or civic, that architecture might pick out of the baser elements and carry onwards by its subtle influence of imaginative work!

It will be said that this knowledge of the living organism of society, of present conditions of life and work, is matter for general education. That is quite true. It is also true that the difficulty voiced in a recent article in the *Builder*, of selecting only students with the right personal qualifications, is by no means confined to the architectural profession. With the corresponding difficulty of selecting a profession or occupation it is a general experience, and points to the failure of present general educational methods, traditional or modern, in the "leading out" and incipient training of the individual aptitudes and potentialities of the pupils. The majority of boys leave school with but little definite knowledge of the living world of work around them or clear consciousness of bent or calling to their proper share in it.

It seems obvious that each would make the better citizen, able to find and do his part, if instructed, for instance, and, so far as possible by actual observation, conversant with each aspect—historic and biographic, antiquarian, æsthetic, and practical, mechanical and industrial, ethical and economic, home, social, civic, political, etc.—of his own town, and its relations to others and the country beyond. But if this be true in general, how especially so for those whose work it is in collaboration with other arts, and the subordinate crafts, to order, shape, and reconstruct cities, towns, and villages. The architect as master builder must perfect himself not only in his own specialised means of expression, but also in knowledge of what is to be expressed—that is, if he is to be indeed an artist, something of the modern seer and prophet we hear of, and not merely a virtuoso dealing in the academic abstractions of a static culture, which cannot entirely express this highly dynamic and analytic age. And as this method enters, as it is entering, into general education there will grow up a common fund of knowledge and interest in which architecture will find alike truer expression, appreciation, and inspiration. Then perhaps style, which, like character in life, is not to be applied, will reappear, the resultant and summation of many efficiencies, whose aim is true and beautiful building, and not merely wage and profit making.

It is not a matter of returning to traditional methods in education, or of reviving traditional forms in architecture; still less is it a matter of ignoring these and consciously aiming at originality.

Our task is to shape our scheme as the fullest possible preparation for life and work, in a civilisation infinitely more complex than any which preceded it. To effect this it is not enough to study, however perfectly, the scientific, mechanical, and utilitarian attainment of modern times, the beauty and culture of the past, though both are necessary. We must study them in relation, and see that, as the past evolved the present, so also the present in all its complexity involves the past. We shall thus understand both the more truly, and discern what is of permanent or merely of evanescent value in each; we shall also be the better able to see and estimate the incipient future.

So shall we compass a system and methods of education reintegrating its twin aims of practical efficiency, and of a living culture that make for character, individuality, and life truly lived.

PARISH CHURCH, HADLOW DOWN.

The rebuilding of this church is being carried out under the direction of Mr. G. Fellowes Prynne, F.R.I.B.A., and the builders are Messrs. Miller & Selmes, of Eastbourne.

THE ARCHITECTURAL SOCIETIES OF FRANCE:

III.—ASSOCIATION PROVINCIALE DES ARCHITECTES FRANÇAISE.

IN our previous articles we have dwelt upon the constitution and *raison d'être* of the two most important architectural societies in France—the Société Centrale des Architectes and the Société des Architectes Diplômés par le Gouvernement. We have pointed out further that France claims the most ancient descent in organisations of the kind, the first dating back to the Académie Royale d'Architecture, founded at Paris under Louis XIV., by Colbert, on December 31, 1671. The Académie was disbanded by a decree of the French Revolutionary Government, and it was many years before an architectural society again became established on a lasting and satisfactory basis, although there were meanwhile numerous tentative attempts at corporate organisation. Napoleon, who found time to elaborate a code for the Théâtre Français, never apparently found time to draw up the constitution for an association of architects. Meanwhile the necessity for such a body became more and more manifest; the qualified man was suffering from the competition of the unqualified man; he had to suffer from the competition of a sort of professional adventurer who claimed qualifications for an art and profession which were open to the first man whose interest it might serve to assume the title of an architect. When, however, in 1840 the Société Centrale was started, its object was not to close the profession, but to guide the public, and to serve the higher interests of architectural art. It sought to include among its members men of satisfactory attainments, and to exercise over them a certain salutary control. From time to time committees were established and schemes formulated with a view to extending the society's influence and establishing an obligatory diploma for all practising architects; but, after an examination of the question of a closed profession in all its issues (a process which lasted many years), the matter was finally allowed to drop and has not been revived for a decade at least. The second most important society in France the Société des Architectes Diplômés, was not founded until 1877, and was not incorporated until 1902. The students who have passed successfully through the École Nationale d'Architecture of the École des Beaux-Arts are alone entitled to enter its ranks. The membership of the Société Centrale has practically remained stationary for some years, while the younger society has forged steadily ahead, and in the course of time it is not unlikely that it will take the leading position. Both societies insist upon definite attainments on the part of its members: the distinction between the two bodies existing in the fact that, while the Société Centrale does not definitely recognise any particular school of architectural training, or indeed admit that such a training is in itself a sufficient guarantee of competence, the Société des Architectes Diplômés, on the other hand, pins its faith to the excellence of

the studies at the Beaux-Arts as being all that is necessary to turn out a fully-fledged professional man. Down to the present time the work and objects of the two societies have proved in a large degree complementary; they co-operate harmoniously for the general good of their art; it is certainly, however, an added distinction for a member of the younger body to obtain admission to the ranks of the veteran society. In each case, it is sought to maintain the standard of its members and to close its doors to architects who are not *véritablement digne de ce nom*. By keeping this object in view they command the respect of, and possess influence with, the Government, municipal authorities, and private clients. We need make no apology for briefly recapitulating the aims of these societies, because they involve principles which have some bearing on certain movements on this side of the channel.

The Association Provinciale des Architectes Français, the third most influential society in France, and last, so far as our review is concerned, forms, with the two other societies, also an integral part of the architectural organism. It is not an association composed of individual members, but of individual societies; it was founded in 1889. The provincial architectural societies of England, as well as some of the colonial societies, are, as we know, allied to the Royal Institute of British Architects, and in looking back on the history of the Institute one sees that in Great Britain we have arrived at a more practical solution than France of the same problem; we have, at any rate, centralised action. Instead of being directly affiliated with any of the leading French metropolitan societies, however, the provincial societies have combined for corporate action and organised a central office for themselves. The group altogether is made up of thirty societies. The central administration consists of a President, four Vice-Presidents, a Treasurer, Secrétaire-Général, four secretaries, and an Archiviste-Bibliothécaire, all of whom are elected for three years, and are not eligible for re-election to the same offices until after an interval of three years. The objects of the Association are effected through its publications and by means of papers and lectures, exhibitions, congresses, competitions, departmental committees, and so on. A general meeting, composed of delegates from the various societies, is held at least once a year to receive reports, to promote and to criticise the acts of the administrative body, and generally to investigate and promote the affairs and policy of the Association. The by-laws can be modified or altered on the motion of the administration, or of at least thirty members representing three departmental societies, and at least a third of the affiliated societies must be represented at any general meeting at which such a motion is put to the vote.

These are, however, mere items of official constitution and procedure. Let us look for a moment at the general programme of the Association. Its scope is amazing; nothing is omitted. It covers æsthetic, scientific, archæological, and professional aspects of architecture with a completeness beyond the possibility of enumeration in a mere article. We can only attempt loosely to describe its general tendency. So far as archæology is concerned, for instance, the Association seeks to promote the preservation of ancient monuments; negotiates with public authorities or private owners in order to prevent the destruction or mutilation of such monuments, or co-operates with existing societies formed for the same purpose. It assists in classifying and verifying the history of older buildings in all parts of the country. Under the same category of work an especially useful part of the Association's effort is connected with the metropolitan and provincial museums. Catalogues of these are collected and indices provided with the object of co-ordinating special works of interest, which are thus made more readily available for the purposes of study. A certain inspection is maintained over objects of this kind, so that their care may not be jeopardised. In connexion with modern work the Association affords assistance to contemporary exhibitions, and promotes others in districts where it may be useful to stimulate interest in architecture; while the composition of juries, awards, and other matters incidental to the holding of such *salons* also form part of its scheme.

To come to matters of scientific interest, the nomenclature, classification, history, and analysis of materials, natural or manufactured, peculiar to certain districts, together with their price, method of use, advantages or disadvantages, are tabulated: a system which should not only be of service to the stranger who comes within the gates of the aforesaid localities, but also to the architect on the spot. A review of local methods of construction, their advantages or disadvantages, forms also part of this portion of the programme; as well as the compilation of reports on the utility of modern inventions concerned with materials, construction, hygiene, scaffolding, and other matters incidental to the art and craft of building. The programme of the Association has also its sociological aspect. It takes into consideration the education of the workman, which extends to his social and moral well-being, to insurance against accidents, and so on. Other divisions and sub-divisions of the programme are devoted to questions of law, local regulations, ownership of designs, and many matters in a state of transition connected with professional practice.

We have only so far indicated certain portions of the two first divisions of this elaborate code. The characteristic gallicisms employed in the "Duties and rights of an architect towards art, the nation, the State, his family, his masters, and his *confrères*, his clients, builders and (last but not least) himself" need only be referred to in passing, as the ebullition of a well-known formula in the French way of looking at things. Among other matters, however, prescribed for discussion is the question of an obligatory diploma—a point which, as in the case of the Société Centrale, still remains at issue. Legal equity in regard to certain aspects of architectural practice is to some extent provided for by the creation of a fund to serve in law actions of general interest to the profession which it may be thought advisable to take or defend. It is also sought to establish a legal basis for professional charges, which at present depend largely upon the adventitious arbitrament of this or that judge.

It may be gathered from the above extracts that the programme of the Association Provinciale is comprehensive, that it fulfils an extremely useful purpose, and that it provides, as it were, a sort of handy manual for the "compleat architect" in all his relations. Do not let us, however, forget one of its minor items, entitled "*Pseudo Architects*—ways and means to diminish their number and to weaken their action"—from which it will be seen that the French architect, with all his politeness, does not hesitate to call a spade by its right name.

SIR L. ALMA-TADEMA, O.M., R.A.

THE art of painting has lost one of its most able and consistent exponents of the last fifty years by the death of Alma-Tadema: the art of architecture has lost one of its most cultivated admirers, and certainly its most brilliant delineator. His friends have lost a most genial, loyal, and lovable companion. Full of honours and years he has passed away, having attained everything that most artists and most men strive after, yet there can be few who do not feel that he has passed away too soon. His amazing vitality, his humour, his faculty of meticulous accomplishment remained those of a man in the prime of life rather than of one who had more than achieved the Psalmist's span of years. Esteemed by his brother artists, probably no painter of his time, no writer of his time, has to the same extent added so greatly to the public apprehension of classic life and art, of the forms of classic architecture. In saying this we do not think that we are saying a word too much. In the vagaries in points of view and attitudes to which higher criticism has been subjected during the last twenty years there have been moments when the art of Alma-Tadema has undergone, just as in the case of the art of Byron and Dickens, depreciation. That is perhaps the fate of all artists, whatever their *métier* or degree. In the early years Ruskin, with his sympathies for Renaissance and Gothic forms, wrote of him discourteously; in later years there have been critics who have underrated the capacity of the artist largely on account of the cordial and genial manners of the man. That is to say that he was not an artist who was either a protagonist of a new art movement or influenced by "movements" of any kind, any more than the fame that came to him influenced his character in his personal or social relations. Miss Helen Zimmern, who knew him with some degree of intimacy, said that he had no art theories; she ought to have said that his theories were forgotten in his devotion to them, or she ought to have seen that all his work was the expression of a singularly consistent art theory. Alma-Tadema loved to show his work, but he

did not care to talk about the impulses, other than anecdotal or technical, which moved him in the creation of it. He was in this respect rather like Tennyson, who once greeted an interviewer and fervent admirer of his poetry, who wished to discuss his mental processes, to a discourse on beer. After all, is it not the men of smaller calibre, and of a more self-conscious creative gift, who care to talk of the psychological emotions of the hen in the operation of the hatching of the egg? Whatever Alma-Tadema's ultimate position may be in the history of art, we have no hesitation in saying that he will always be counted among the most important æsthetic influences of the Victorian era. His influence was certainly outstanding in the cultivation of taste for certain phases of the beauty of design and form of ancient life which were appreciated by very few. He made concessions to the sentiment of his time—it would be probably more just to say that he sincerely felt it; but his sentiment was not of the kind which creates the merely subject picture. It was "a-lover-and-his-lass" kind of sentiment, if you like, or it was the sentiment of "motherhood" (at least in one of his pictures); but these or other elemental and, we daresay, eternal expressions of human emotion did not form more part of his art than his love of form and a certain mannered delicacy of colour. His art was popular on account of its sentiment; it was also popular on account of the artist's subtlety in the understanding of the texture of various marbles (surely a joy in itself); these things could be readily grasped by everyone; but such sentiment and such appreciation of the texture of a given material played only (to our thinking) a small part in the composition of his pictures, because they also possessed, in construction and form, higher and more abstract qualities of beauty. Alma-Tadema was not psychological, not at any rate in the personal sense in which we understand the term to-day—that is to say, his art was a detached, not merely a personal, expression of his moods. It was, we think, Leonardo who said that no artist was capable of producing more than seven masterpieces; we believe that we could readily indicate that number in Alma-Tadema's work which would include others than those which are most generally familiar in reproduction.

NOTES.

Methods of Business and Architecture.

THE business man has again cropped up in the question of the Registration of architects. It is the inevitable herring drawn across the path. "It is now generally accepted as an axiom," we read, "that the architects of Great Britain who are in favour of Registration outnumber those who are not so disposed in the proportion of eight to one. But the minority includes many of those who have attained prominent positions as able artists and successful practitioners. Amongst these able artists are some who adopt business methods which in the professions of law and medicine would cause their names to be erased from the register. Naturally, therefore, they are strong opponents of Registration for architects." We consider the premises, illustrations, and conclusion of this argument to be equally mistaken. In any case, a man who is at once an able artist and successful practitioner can very well allow such criticism to go by the board, and certainly if such men are against Registration their opinion ought to carry more weight than those of less proved capacity. The business of architecture is the production of fine buildings, and a man who is absorbed in this view of his art may often be inattentive in smaller matters. But he rarely is. We do not know who the writer of the article in question has in mind, but our experience of the merely business methods of our prominent architects is probably not less than his, and we cannot agree with him. Not only as a rule, but almost inevitably, the type of mind that can create good architecture is more competent to consider the higher aspects in regard to architectural policy than that engaged first of all in comparatively the elementary problems concerned with business methods. In the same article we read that the Institute must "recognise and placate the Society of Architects if Registration is to obtain the approval of Parliament." But why should this question arise? When the Institute promotes a Bill it will be in the interests of the profession as a whole in which the Society will be necessarily included, and not in the interests of any one section.

Freedom of Labour and in Life.

MR. L. MARCH PHILLIPPS, in an article in the *Contemporary Review* entitled "The Gothic Ideal," commences by pointing out once more his favourite distinction between the two possible ways of approaching the consideration of a great architectural style. The one, aridly technical and professional, deals with the characteristic forms of a group of buildings as interesting in themselves; the other, full of interest and human significance—this is Mr. Phillipps' way—would see, in the essential characteristics of a style a symbolic epitome of the age which produced it. He goes on to indicate his conception of the Gothic ideal that "may be stated in a sentence, though it is not to be exhausted by much thought It consisted in that theory of free labour, the chief condition of which was that the control and direction of every craft should be in the hands of its own craftsmen, and that, not only as regards the supervision of its members, but as regards also the quality of the work accomplished and the standard of excellence to be maintained." He thereupon proclaims the adequacy of that equation which has it that material, by craftsmen, equals the product, asserting that the influence of x, patron or consumer, is clearly malign because it tends to modify the action of that perfect pair, material and craftsman, which, left to itself, would result in the production of objects fashioned to manifest the inherent capacities of the material employed. Mr. Phillipps, that is to say, seeks again, in his own way, to convert us to doctrines with which we are all made sufficiently familiar, and to which, as far as he goes, we are already converted, by the forensic splendour of Ruskin and the lucid fervour of Morris. And he concludes inevitably by pointing the moral to statesmen—for them it chiefly concerns though they be so sadly unaware of its truth as yet—that political liberty is only a meagre half condition of the well-being of a nation. This, too, is a fact of which those who think more highly of Ruskin as a "political economist" than as an æsthetic teacher, are well aware.

The Craftsman and His Work.

THUS the second half of his paper is all plain sailing. But uneasiness, or perhaps we should frankly say disagreement, sticks in our consciousness with regard to the implication of his premise. For the implication inseparable from the assumption that it is best for the craftsmen to be left alone to fashion his material in accordance with its inherent potentialities—best, we must suppose him to mean, for the hope of a great style—is assuredly that the values of a style are to be appraised, relatively, according to the measure in which the qualities of the materials employed are displayed. Which is, we fear, absurd. And there is the further fallacy involved that the material with which all craftsmen—we do not confuse the issues by including the artist in this category—have to deal consists solely of the wood, iron, stone, or whatsoever it may be. Which can never, even under the most primitive conditions conceivable, be the case. Before the craftsmen can attempt anything that shall have some of the quality implied in the term "craft," as opposed to manufacture, he must have, besides a knowledge of the use to which his product is to be put, some conception, conscious or unconscious, of the shape it is to assume and, in cases, of the decoration to be employed. This shape, these decorative forms are relative, however distantly, to the culture, to the civilisation, that is to say, of the age; so that the spirit of that civilisation becomes part of the material in which the craftsman has to work. Now all is indeed well, we readily grant, when the craftsman is on all counts in accord with his patrons, his customers, or, in current phrase, the consumer. But that beatific condition has seldom been attained. At other times, when the craftsman falls short or when his masters progress in some purely cultural direction, x the master, consumer, patron, reassumes control. It is x the variable quantity, the malign influence, as Mr. Phillipps would have us believe (malign to-day we admit), that determines the quality of the product of our equation in the last resort, and is to be given credit, therefore, in the great periods, even by Mr. Phillipps, equally as it is condemned to-day.

Mr. Stokes's Portrait.

IT is the custom at the Royal Institute of British Architects to decorate its walls with the portraits of their Past-Presidents by eminent artists. The portrait of Mr. Leonard Stokes, by Mr. William Orpen, was presented to the Institute on Monday evening, on the eve of his retirement from the Presidential chair. Mr. Orpen will find himself represented

in good company on the walls of the Institute, with Sargent, Orchardson, Alma-Tadema, and many other eminent artists, and this latest example of his work will certainly stand the test and add to his reputation. But Mr. Orpen has not sought to solve the same problem as his brother artists; he has obviously not considered the President in his official aspect, but in the light of a much greater intimacy. Mr. Stokes is, in short, painted in his dressing-gown. The garment adds colour which makes for pictorial value, but it seems a little inconsequent for the collection of which it is to form part. We have nothing but admiration for the fidelity and artistic effectiveness of Mr. Orpen's work, but if portraits painted for official purposes are to descend to the familiar, where is the artist going to stop?

CONTEMPORARY ARCHITECTS AND THEIR WORK:

MR. BASIL CHAMPNEYS.

THE occasion of the presentation of the Royal Gold Medal affords fitting opportunity for a few reflections upon the work of the recipient, in the present instance a man whose name has been as familiar as their own to a generation of English architects. That his work for forty years or so past has attained a high standard is attested by the mere fact that with the whole range of practising architects and *savants* to select from, the choice of the Royal Institute has fallen upon one who makes no other appeal—apart from his contributions to pure literature—than through his executed buildings, and, moreover, one who is not so much as numbered amongst their own ranks. This bears testimony to the broad-minded policy of the Institute, which has ever been followed in this connexion of recommending to the Sovereign the name of a man of distinction, irrespective of his rank, architectural creed, and even nationality. Inspiring, indeed, are the thoughts which flash through the mind as one scans the list of Gold Medallists from 1848, when the award was given to the immortal Charles Robert Cockerell, until 1911, when the distinguished foreigner, Dr. Wilhelm Dörpfeld, was honoured. Now Mr. Basil Champneys figures in the list. Nor could it well be otherwise if due recognition was to be meted out to one who has never sought honours. "The reward of good works is like dates, sweet and ripening late," as they say in the East. But if the works are "good," the reward will surely come. Fame, indeed, usually comes to those who are thinking about something else.

Mr. Basil Champneys, Architect.

In considering the work of an artist it is as refreshing as it is rare to find that the leading characteristic of that artist is his versatility, his mastery of design in manners, which at first sight might appear to be opposed one to another. It is a commonplace talked of every day, written about in any magazine article and book dealing with modern architecture, that traditions in the building arts are broken; that building, which all through the ages has portrayed with amazing truth the thought, culture, and civilisation of the peoples who reared it; that architecture, the Mistress Art, is to-day captive, and led blindfold along a tortuous route, reflecting little more than the restless change of a restless age, and the idiosyncrasies of the few who hold the leading chairs at any particular moment. Thus, although we are no longer fighting "the battle of the styles," we have our little coteries of the elect, who on this side of the street shudder at the sight of a classic column beneath this cloud-ridden sky of ours, while an equally enthusiastic circle on the other side of the street point at a cusped window-head the finger of scorn. But great artists will have none of this. Men like Mr. Champneys do not pose: they speak in brick and stone in the manner that they feel most expressive of what they have to say in view of the environment, the uses and the conditions underlying any particular building which they are called upon to erect. And so they belong to no particular "school," but keep their armour bright to champion any cause that comes within the range of their ideal. And who shall tilt at that ideal in a land which boasts something of the best in each phase which at some time or another has swept over Europe? However sensible one may be of the just proportions and extreme refinement of the best of the English neo-Classic work of the XVIIIth and XIXth centuries, one nevertheless sooner or later chafes at the boundaries within which one's admiration is confined.

Mr. Champneys, conscious of the voice within him, has penned many beautiful thoughts: his "Quiet Corner of England," written many years ago, is still widely read, and his "Life of Coventry Patmore" forms one of those subtle links in the chain which unites Architecture with Poetry. In design, he has harked back to earlier models than those favoured by most of his *confrères* to-day—in short, to those afforded by the best examples of our own XIVth and XVth century Gothic

Mr. Basil Champneys, Architect.

and by the least affected and least pretentious of our own matured Renaissance. He has worked now in the one manner, now in the other, but the message has always been direct; the spirit permeating the one being of the purest Gothic, and that of the other an equally whole-hearted Renaissance. While avoiding a slavish rendering of any particular period of the past, there is nevertheless that scholarship underlying his simplest building which indicates sympathetic study of the best old examples of its class. The variations on the old work are not obtrusive. They do not appeal first and foremost by reason of their originality, but they strike that unerring note of interest without which scholarly work is apt to be cold, lifeless, and meaningless in an age of progress. And working with materials which have been common to all time, on the kinds of buildings which for hundreds of years have changed least in their essentials, such as colleges, churches, and dwelling-houses, what more can the architect of to-day achieve than to carry on the best traditions, as near as may be from the point at which our forefathers unwillingly dropped them, with just that touch of individuality which, all unconscious of forced effect, expresses itself quite naturally and indeed inevitably as the outcome of the conditions imposed?

Beyond all, we see in the work of Mr. Champneys, as clearly as in that of the best artists of our day, no timid presentation of a limited point of view, but a robust expression relying freely upon every variety of contrast, in projections and recesses, in varied heights, and light and shade applicable to the materials used, and to the impression which the designer seeks to impart. In contemplating Mansfield College, Oxford (Fig. 1), for instance, we are conscious of that ease of execution and skilful massing of parts which one feels in the presence of the best old work of its kind. The same fundamental principles underlie this composition that are found in such buildings as those at Newnham College, Cambridge; in all else they are the poles apart: and until one realises the breadth and depth of the mind of a great architect one is surprised that it is possible for the same man who feels all the subtle delicacy of Gothic detail, and in whose veins the beauty of Gothic lines vibrate, to approach "design" in the totally different manner which is at once evoked by an emulation of the Renaissance.

It would seem that the atmosphere in which Mr. Champneys lived his early years has, in a measure, determined his sphere of work in after life. The son of the Rev. William Weldon Champneys, Dean of Lichfield, a scholar of Charterhouse, and in due course a graduate of Trinity College, Cambridge, he was from the start imbued with a love for literature and for collegiate and ecclesiastical architecture rather than with the desire to rear public buildings or to line the streets of our cities with blocks of shops and offices. Not that the scope of his executed work has been confined to these two classes of building, albeit they predominate, for a glance through the list of his executed works reveals many houses, not a few libraries and museums, and such semi-public buildings as the Indian Institute, Oxford, and the Royal Palace Hotel, Kensington. It is nevertheless in his buildings associated with, or forming an integral part of, the older Universities and with ecclesiastical buildings large and small that we feel that Mr. Champneys has found his *métier*. The mere enumeration of

Fig. 4. King Edward VII. Grammar School, King's Lynn: General View.
Mr. Basil Champneys, Architect.

them is no slight undertaking, and we propose to dwell upon but two or three here, referring our readers to the more exhaustive list which will be found at the end of this appreciation.

Newnham College, Cambridge, is a monument in itself. Begun in 1873, when Mr. Champneys cannot have been in practice for more than a few years, and added to from time to time by the building of hall after hall, until as recently as 1910, when Peile Hall was completed, it presents to-day a series of large houses, each complete in itself, but linked up with the rest, so as to present an extended elevation of very considerable dimensions, varied in design from end to end, yet in unison, depending as it does for cohesion on the spirit that animates the whole design. Quiet, dignified, and, above all, cheerful, it is difficult to imagine a setting more suited to life in a woman's college. And we do not think it will be disputed that the architect, who by such straightforward methods as have been adopted here gives pleasure and comfort to the hundreds who come and go year by year, has served the State well, inasmuch as the influence of the immediate surroundings upon the dwellers in any institution is consciously or unconsciously very real, and much greater than is generally acknowledged to-day.

An exterior view of Clough Hall, together with an interior of the dining hall, will be found on one of our plates, while in Fig. 2 is a view of Peile Hall, with one side of Fellows' Buildings on the right, and in Fig. 3 a part of the latter block facing on to Sidgwick Avenue. These speak for themselves; but the handling of the interior of Clough Hall, which serves for a variety of college functions, is particularly happy with its skilfully-arranged gallery and beautiful plaster ceiling of unusual form.

Another women's college, somewhat less in extent but not in importance, is Bedford College, which is now in course of construction in Regent's Park. We will not venture to offer any remarks upon works in progress, but we are fortunate in being able to reproduce the large pen-and-ink sketches which, if allowance be made for certain modifications which will inevitably suggest themselves as the work proceeds, gives some idea of the general character of this latest addition to London's educational centres.

From 1873 to 1912 is a wide span, and one thinks of Bodley and Bentley, of Mr. Norman Shaw and Mr. T. G. Jackson, as forming a little band of workers to which Mr. Champneys by right belongs. They have done, and some of them fortunately are still doing, fine service to the cause of architecture, and it is to Oxford and Cambridge, no less than to the principal cities, that one turns for evidences of their skill. At Oxford, Mr. Champneys has carried out extensive

additions to New College, Somerville, Lady Margaret and Merton Colleges (page 747), while he has recently made extensive additions to Oriel College, in a phase of free Renaissance which is not altogether pleasing to certain of the more devout worshippers at the shrine of their Alma Mater. A view taken from the quadrangle of this new part of the College is given on one of our plates.

As with colleges so with schools, the list of Mr. Champneys's achievements is a long one. He has built at Winchester and Harrow, and with equal success at Mill Hill, Hendon, at the Bedford Grammar School, at King's Lynn (Fig. 4), and in too many other localities to enumerate here. Allied with these educational buildings are the libraries and institutes, of which the more important are the Indian Institute, Oxford (Fig. 5), built about 1885, and the John Rylands Library, Manchester, a most notable Gothic building, held in high repute throughout England. Here one is impressed not so much by the masterly handling of Gothic detail as by the arrangement of planes and the grouping of masses in the restricted front elevation. How well the small octagonal towers tell above the comparatively plain wall surfaces beneath; and above them again, at exactly the right distance and of the right height, are the two square towers composing admirably against the sky.

In laying stress on this collegiate and scholastic tendency noticeable in the career of Mr. Champneys we must not lose sight of the large number of churches that have fallen to his lot to build or to make additions to. Here, again, we are confronted with a list wherein figure many designs which have been seen upon the walls of Burlington House year by year. In point of number Stafford leads with alterations and additions at Tamworth, Wednesbury, Alrewas, and Tatenhill, besides the erection of Slindon Church, near Eccleshall, a most interesting little country church. In Kent, at Bexley and Matfield; in Lancashire, at Upholland and Stonefold; in Derbyshire, at Chilcote, other ecclesiastical work may be seen, to say nothing of the considerable additions to the cathedral of Manchester, with its wealth of exterior detail and its beautiful choir and reredos (Fig. 6). But this has been visited by most architects at some time or another, and we have, by preference, selected for illustration two smaller churches, which are probably not well known. The first is the exterior of St. Luke's, West Hampstead (Fig. 7), which, to a modified degree, is permeated with the same rich flavour that characterises all his ecclesiastical work. The austerity of a Street or a Scott is not attempted; rather are we conscious of a sensuous beauty such as Sedding, for one, knew how to impart. The other church, that of St. Michael and St. Andrew, at East Greenwich (Fig. 9), is a characteristic suburban one. The main disposition of the nave arcade, with one constructional bay where two are more customary (see plan, Fig. 8), was suggested by the peculiar nature of the subsoil, which called for as few points of support as practicable. It shared the great consideration sacred to its class—unfortunately not to that class alone—of the provision of the largest possible number of seats at the lowest possible cost consistent with its use and purpose. In spite of this restriction, severe always and doubly so in a church, this interior is good. It would be well if a tour of the suburbs revealed many worthy to be classed with it.

Fortunate, indeed, in these days is the architect who is able to maintain control, not only over the structure, but over every detail and fitting connected with it. Mr. Champneys has many times succeeded in keeping the design of the whole of the subsidiary works in his own hands, but unfortunately, in this particular instance, he was unable to carry out what is often the most important feature in a church, namely, the altar, and in justice to him this must be borne in mind in considering the view of the interior reproduced herewith.

To house-work space will not permit more than a passing reference. Were it not that Mr. Champneys has done even better in other fields, one would be tempted to say that here he excels. Restrained, when circumstances demand it, as in the case of St. Bride's Vicarage, Fleet-street (Fig. 10), beneath the shadow of Wren's steeple; fanciful when unrestricted, in the open country, Mr. Champneys's houses are always "domestic," and it may be said that a nice sense of fitness, a straightforward solution of the problem in hand, an unaffected use of honest materials are what one finds wherever building work has been entrusted to him, whether it be at the Universities, in the towns and cities, or in the open country.

LIST OF WORKS BY MR. BASIL CHAMPNEYS.

University Buildings.

Oxford.—Indian Institute, New College (Robinson Tower, students' rooms, and Tutor's House), Merton College (new buildings), Mansfield College, Oriel College (new buildings), Somerville College (library); Lady Margaret Hall (additions).

Cambridge.—Divinity and Literary Schools, Archæological Museum, Newnham College.

London.—Bedford College for Women, Regent's Park.

School Buildings.

Harpur Trust School for Girls, Bedford; Bedford Grammar School (new buildings in square); Harrow School (Butler Museum and classrooms); Mill Hill School (chapel); Winchester College (Quingentenary Museum); King's Lynn Grammar School; Wilmcote; Eelbrook Common; Tanderidge; Johnson street, Stepney; Tamworth (Cookery School); St. Ebbe's, Oxford; Holy Trinity Schools, Oxford.

Rectories and Vicarages.

St. Bride's, Fleet-street; Haslingden; Okewood; Yately; Tatenhill; St. Luke's, West Hampstead; Wootton; Wortley.

Churches.

Manchester Cathedral (reredos and high altar, Victoria porch, new library, vestries, and other work); St. Luke's, Kentish Town; St. Peter-le-Bailey, Oxford; St. Mary Star

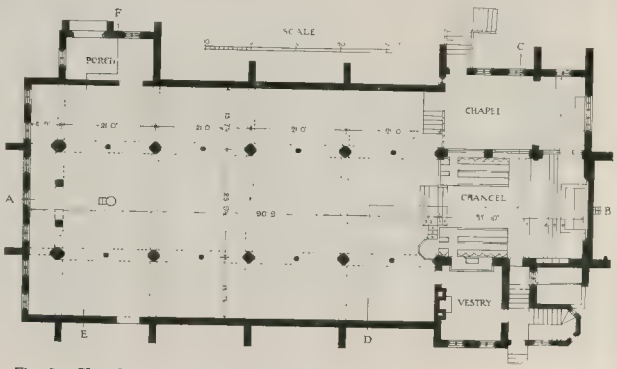

Fig. 8. Church of St. Michael and St. Andrew, East Greenwich: Ground Plan.

Mr. Basil Champneys, Architect.

Fig. 9. Church of St. Michael and St. Andrew, East Greenwich.

Mr. Basil Champneys, Architect.

of the Sea, Hastings; Havering-atte-Bower; Matfield, Kent; Glascote, Warwickshire; Stonefold, Laneside, and Blackley, Lancs; Slindon, Staffs; St. Luke's, West Hampstead; St. Andrew and St. Michael, East Greenwich.

Houses.

70, Ennismore gardens, S.W.; Banacle Edge, Witley, Surrey; Moxley, Holmbury; Haileybury, Bournemouth; house in Grange-road, Cambridge; Crowborough Wood, The Grange, and Matfield Gate, Matfield, Kent; Hall Oak, Oak Tree House, Richford Lodge, and 45 and 47, Frognal, Hampstead; house at Lynton, Devon; house at Bracknell, Berks; houses on Ascot and Sunningdale Estate.

Alterations and Additions.

Churches.—Tatenhill, Tamworth, Wednesbury, and Alrewas (Staffs); Bexley, Kent; Upholland, Lancs; Chilcote, Derbyshire; Okewood, Surrey; St. Dunstan's, Stepney; St. Bride's, Fleet-street; St. Alfege, Greenwich; St. George's, Camberwell; St. George-the-Martyr, Southwark; St. Mark's, Kennington; Colnbrook, Barton-under-Needwood.

Various.—Poyle Park; Heron's Ghyll; Wortley Hall; Gatton Cottage, Surrey.

Miscellaneous.

John Rylands Library, Manchester; Blue Hart Company's Office, Blue Hart-court, E.C.; Swan-chambers, Swan-alley, E.C.; Royal Palace Hotel, Kensington; studio at Shere, Surrey; Fawcett Memorial, Embankment; All Saints' Memorial, Cambridge.

D

THE ROYAL GOLD MEDAL.

THE last meeting of the present session of the Royal Institute of British Architects was held on Monday, at No. 9, Conduit-street, Regent-street, W., Mr. Leonard Stokes, President, in the chair.

The minutes of the last meeting having been taken as read,

The announcement was made by Mr. E. Guy Dawber of the decease of the following members :—

E. J. Milner Allen, elected Associate in 1882 ;
Lewis Angell, elected a Fellow in 1864 and placed on the list of retired Fellows in 1902;
A. E. Twells, Licentiate ;
W. E. Wallis, Associate, elected in 1882.

The Fellowship.

The President said that most Fellows of the Institute had passed through an examination and special test, but the Council had the right in exceptional cases of electing distinguished men without examination and test, and he had to announce—and he did so with much pleasure—that the Council had elected as a Fellow a gentleman who was the third generation of a distinguished family of architects—*i.e.*, Mr. George Gilbert Scott, whose grandfather was Sir George Gilbert Scott, his father being Mr. Gilbert Scott. As they knew, Mr. Scott was the designer of Liverpool Cathedral, and those who had seen the portion already erected would admit that it was extraordinarily fine, and they would all agree that the Institute was doing honour to itself by adding Mr. Gilbert Scott to their ranks.

The Royal Gold Medallist.

The President having received members attending for the first time since their election, said :—

"We meet to-night, as you know, to do honour to our very distinguished *confrère*, Basil Champneys, by handing to him the Royal Gold Medal which, on our recommendation, has been conferred upon him by our Royal Patron and King—George V.

The Royal Gold Medal, it is not necessary to remind you, is the highest honour—architecturally speaking—that can be bestowed upon a member of our profession, and we have only to recall the names of former recipients to find that they belong to men who, if alive, are honoured, respected, and admired by all of us; or, if dead, are acknowledged to have been the great men of the age they lived and worked in, and it is only necessary to mention such names as Cockerell, Barry, Donaldson, Smirke, Tite, Owen Jones, Scott, Fergusson, Street, Sharpe, Penrose, Butterfield, and Bodley, as amongst those so honoured by their Sovereign to prove the statement—if proof is necessary.

On these occasions it is usual for your President to remind the meeting of the main features connected with the medal and its history, and to say a few words about the career of its recipient; we had better, therefore, follow that course to-night.

In the year 1848 Queen Victoria, who had about ten years previously graciously consented to become Patron of our Institute, resolved to grant and confer annually, at the recommendation of the Institute, a Royal Gold Medal for the promotion of architecture. The award has been made without interruption in each succeeding year—except in the year in which Queen Victoria died—to some distinguished man; not always an architect, as we readily admit that there are others who by their works can and do promote architecture—for example, literary men, who by their books and pens greatly advance the cause we have all so much at heart, and they have on several occasions received this medal. Again, the recipient need not be an Englishman; Italians, Austrians, Frenchmen, Germans, Dutchmen, and Americans have all received the medal. So far, however, it has not gone to an inhabitant of one of our great colonies, not because excellent work is not being done there, but perhaps because they are mostly of such vast extent, and so far off, that we on this side have not been able to get sufficient information to enable us to submit the name of a Colonial to our Sovereign. I hope, however, now that travel is getting every day easier, and inter-communication more complete, that it may not be long before the medal goes to one of the great Dominions beyond the seas.

And now we turn to the gentleman upon whom it has pleased his Gracious Majesty to bestow the medal this year. Though not a member of this Institute, and consequently not quite so often seen in this room as we could wish, yet Basil Champneys, at any rate in his work, is well known to all of us; and those whose memories can carry them back, say, a quarter of a century or more, will with one accord proclaim that his distinguished career has been followed throughout with interest and admiration, and that the honour now conferred upon him, backed up as it is by the unanimous vote of this Institute, and confirmed by the King, is but a well-merited distinction added to a brilliant though unostentatious career.

Basil Champneys is the son of William Weldon Champneys, Dean of Lichfield, and was born in 1842. He was educated at Charterhouse, where he was a Foundation Scholar and Gold Medallist, and Trinity College, Cambridge, where he took an honours degree in Classics. He studied architecture under John Prichard, of Llandaff, and began practice in 1867, and has kindly read papers before this Institute on more than one occasion. Some of his works are illustrated on the walls to-night, and it is naturally to his executed works that we turn when thinking of him as an architect, and to his published works when thinking of him as an author. Fortunately for us he has done a good deal of work both at Oxford and Cambridge which is easily accessible.

At Oxford we find : The Indian Institute ; the Robinson Tower and new buildings at New College ; Mansfield College (it is not often that a complete college is erected from the designs of one man, and this is consequently perhaps one of Mr. Champneys' best-known works, and it always receives the admiration it so justly deserves) ; new Quadrangle and Warden's House at Merton College ; and new buildings for Oriel College—one of his most recent works.

At Cambridge : The Divinity and Literary Schools and all the buildings of Newnham College.

Other public buildings of a collegiate character may be seen at Bedford, where we find the Harpur Girls' Schools and Grammar School buildings in the square ; and at Harrow, where the Butler Museum and new classrooms may be seen. Also at Winchester we find the Quingentenary Museum ; at King's Lynn, the Grammar School ; and in Regent's Park, the Bedford College buildings (now in course of erection).

Again, at Manchester may be seen one of Mr. Champneys' perhaps largest works, viz., the John Rylands Library, and also the reredos,

Fig. 10. St. Bride's Vicarage, Fleet-street, E.C.

Mr. Basil Champneys, Architect.

Victoria porch, library, and vestries at the Cathedral.

Amongst churches erected from his designs are: St. Luke's, Kentish Town; St. Peter le Bailey, Oxford; St. Mary Star of the Sea, Hastings; St. Luke's, West Hampstead; St. Andrew and St. Michael, East Greenwich, etc. And houses: Bannacle Edge, Witley; Crowborough Wood, Matfield, Kent; and St. Bride's Vicarage, Fleet-street, etc.

Of course, this list might be very much amplified, but enough examples have been mentioned to show the varied character of his work and to prove the uniform excellence of all that comes from his hand.

As hinted just now, Mr. Champneys, besides being a distinguished architect, is also well known as a writer, possessing genuine literary power—a gift, unfortunately for us, not by any means common amongst architects. Books are produced by architects no doubt, but there are very few of us who can really write, and when we find one who can—as Basil Champneys can—we should like him to feel that we are aware of the fact and much appreciate his powers. Anyone who has read his "A Quiet Corner of England," which dealt with that delightful district round Rye, Winchelsea, and Romney Marsh, written some thirty or forty years ago in a pleasant leisurely way, with an appreciation of English XVIIIth-century vernacular rare in those days, will agree that it is an admirable little work. He has also written on William of Wykeham; but no doubt his best-known work, and probably, too, the best thing he has done, is his "Life of Coventry Patmore," which appeared in two stout volumes in 1900, and is in its way a masterpiece in biography, written with fastidious care and most sympathetic appreciation of his subject. This book alone is enough to make a reputation, and with these great gifts, and being so widely read, and knowing his way about so really well—if the expression can be forgiven—it makes one almost regret—if one is allowed to get so near a regret on an occasion like this—that he has not applied himself more to the critical treatment of architecture in his writings.

Having dealt with the medal, and also briefly with its recipient in his dual capacity of architect and author, it only remains for us now to hand the medal to Mr. Champneys, with the earnest hope that he may live for many years to wear it, and that while he wears it he will remember that his Sovereign, in bestowing this well-merited token of his Royal approval on him, did so on the unanimous recommendation of the members of this Institute, who one and all have the greatest admiration for the work and character of Basil Champneys."

The President then invested Mr. Champneys with the medal, amidst applause.

Mr. Champneys, in response, said: "I must thank the President for the very kind and appreciative words he has spoken of my career and work, and express my sincere gratification at the great and distinguished honour which the Institute has conferred on me. That this recognition should have been paid to me, an outsider, carries with it a satisfaction not altogether dissimilar to that which I have felt in having been employed far more frequently at Oxford than at Cambridge, my own Alma Mater; nor can I fail to recognise the generosity implied in the award. This tribute on the part of the Institute is, in fact, but a more conspicuous mark of the courtesy and consideration I have always received from that body, and to which I have responded to the best of my ability. The President and Council have invited me to assist in their endeavours to place architectural education on a sounder footing; to read papers and take part in discussions on questions of art; and some years ago paid me the compliment of asking me to read a paper on a building which I had recently erected. I may say, too, that however gratifying may be recognition by the general public, which I do not wish to depreciate—it is indeed necessary if it be only to offer opportunities and to "bring grist to the mill"—no artist can fail to attach an altogether predominant value to the judgment of those who are actually versed in the practice of his own art.

An occasion like the present seems to justify a brief retrospect of the phases and tendencies which have been manifest during a period of not much less than half a century which I have spent in the study and practice of architecture, and a still briefer anticipation of the problems which must present themselves in the future. I may claim to figure as an old soldier in the army of artistic endeavour, *jam rude donatus*, presented with the emblem of warfare accomplished—with indeed this reservation, that I regard the medal not as a symbol of retirement, but as an encouragement of future effort—at any rate so far "emeritus" as to have the right of passing in review the battles which have been fought in my day, disclaiming at the same time any such preponderant part in them as was exercised by "Bill Adams" on the battle of Waterloo.

When my architectural studies commenced Gothic was in its heyday of popularity. I was nurtured in the strictest school of the Pharisees, whose dogma was: "No salvation out of the XIIIth century." It is true that even within the limits of this rigid and exclusive school there were divergent tendencies. Ruskin was using the influence of his unrivalled eloquence towards the adoption of Italian examples, while others advocated French characteristics. There seemed a danger that the lessons of our national Gothic might be neglected. It seemed, too, as though an exclusive preference were often associated with an imperfect comprehension. The genius of Gothic architecture must often have wondered at the fruit engrafted on it: "*Miratus non sua poma.*" It is indeed worth remark that the most complete and scholarly studies of mediæval architecture have been produced since the vogue of the style has passed. The measure of exclusiveness was the ruthless fervour which consumed all which failed to conform to a Procrustean standard: the measure of ignorance was the misunderstanding of many important principles and precedents; the result of the two combined was the ruin of many of the most valuable monuments of the very style which was the object of adoration. An antidote to, or at least a palliative of, some of these imperfections was the work of Butterfield, which showed a true insight into the essential spirit of Gothic architecture; I can recall the overpowering impression of, as it were, a new revelation, which All Saints', Margaret-street, made on me in my school days. Such insight was combined with strong and original creative power, while Bodley, with somewhat similar endowments, was beginning to demonstrate the potentialities of purely English style.

Meanwhile a rather later school was resuscitating the latest phases of Gothic, showing the capabilities of half-timbered work in domestic, and of the XVth century, our one specially English style, in ecclesiastical building. The original orthodoxy had been shaken, discredited partly by the abuse of precedents, partly by its inadaptability to modern uses, partly perhaps by a sense in the public of *toujours perdrix*, and the way was open for new tendencies to creep in. The mixed styles of the Low Countries, the English work of the XVIth, XVIIth, and XVIIIth centuries, the French Renaissance, all found their advocates, while these in turn appear, so far at least as secular building is concerned, to be yielding to a more correct and scholarly study of classical examples, so that in my own time fashion seems to have come full circle.

It is useless to lament efforts in the past, apparently fruitless, but which may nevertheless have led to an increased insight into the principles which underlie all phases of art, nor is there need to regret the tendencies of the present. These are not indeed surprising, seeing that, somehow or other, the classical spirit seems less remote from our ideas and civilisation than that of the Middle Ages, and if exclusiveness of appreciation is to be deprecated, coherence and concentration of purpose is a condition favourable if not essential to the welfare of art.

There are, however, certain problems already presented to architecture which must severely tax ingenuity and invention in the immediate future. Our art has been defined as that which "makes construction beautiful," but commercial considerations, entailing economy and speed, are leading to the extensive use of a method by which metal construction is clothed with an external facing practically independent of it. In the absence of any organic relation between structure and external appearance it is hard to see how the principle of this definition can be complied with. Similar influences dictate that the ground floor of commercial—a majority of town buildings—must show an unbroken expanse of glass, but a superstructure apparently carried on an unsubstantial material can scarcely fulfil the primary conditions of architectural integrity.

I have mentioned these problems not with any view of suggesting their solution—indeed I may congratulate myself that I have been quit of them so far, and may leave them to others—but recognising that they have to be reckoned with by a younger generation unless a large proportion of necessary buildings are to be permanently banished from the domain of legitimate art. Let us hope that the talent, which undoubtedly exists, may prove equal to obviating the necessity of such a fatal exclusion.

Once more I would express my thanks to the President and the Institute who have conferred on me this most welcome honour."

Portrait of the President.

Mr. J. W. Simpson said it was with great pleasure that he rose to fulfil the duty placed upon him of unveiling the President's portrait and in offering it on behalf of the subscribers as a gift to the Institute. The portrait was a characteristic one, by Mr. William Orpen, who unfortunately was not present to receive their congratulations, but the artist had produced an admirable work of art worthy to be placed beside those other portraits by distinguished painters like Sargent, Orchardson, Alma-Tadema, and others of Past-Presidents which adorned the walls of the Institute. The Institute was justly proud of its portraits, and that of their present President maintained the splendid standard of achievement of their painters. That part of his (the speaker's) duty he fulfilled with particular pleasure, but the second part—*i.e.*, that of moving a vote of thanks to the President for his services during the past two years—he performed with less satisfaction, for their gratitude for benefits received was tempered with regrets by the thought of losing their benefactor. It was true they did not nowadays place their Past-Presidents at once upon the dusty shelves of memory, for they retained them upon the Council; but after two years of work their Past-Presidents did not attend very often at the meetings of the Council. It was thirty-four years since his friendship with the President began in the Royal Academy schools, and he and the President had studied under such men as Mr. R. Norman Shaw, Alfred Waterhouse, and others. How easy work was then, and what admirable things they invented! But how difficult it all seemed now! He and the President entered the Institute in the same year, but, while he had to pass a painful examination, the President was elected upon those merits which they all knew. The work which Mr. Stokes had done for the Royal Institute of British Architects was very great, and it was no light duty that a President accepted when he undertook to carry their flag abroad and direct their Councils at home. Those who had seen the President at Council meetings only had little idea of the immense amount of work carried on behind the scenes, and the increasing amount of time which had to be devoted to it, and he sometimes wondered how long the Institute would be able to command the services of such men as they wanted as Presidents, having regard to the enormous demands made upon the President. Fortunately public spirit was not lacking, and men were still forthcoming to shoulder the burden for the good of the profession. He supposed that no President ever vacated the chair without the private conviction that he had failed in fulfilling the intentions with which he took up the work; but the failures of honest men were the foundations on which their successors built, and in the course of a rather long experience he (the speaker) had never met a man with more pellucid honesty of purpose than their President. During the President's two years of office the membership had increased by leaps and bounds, and the Town Planning Conference over which he presided resulted in architects being recognised by the public once and for all as the proper persons to be consulted in the development of cities. During the same period the ownership of the architect in his artistic conceptions had been placed by Parliament on the same footing as with painters and sculptors, and the new Charter and By-laws had come into operation. The Board of Architectural Education, with wide-reaching powers, had also been set up, and the School of Architecture at Rome, for which they had worked for years, had become an accomplished thing. The duties of President were exacting and arduous; they would be intolerable if they were not appreciated by the members. Their gratitude was his reward,

and he asked them to show their appreciation by their applause.

Mr. J. S. Gibson appropriately seconded the motion, which was heartily agreed to.

The President, in reply, accepted the portrait of himself on his own behalf and on behalf of the Institute, explaining that it was at Mr. Orpen's request that he sat in his dressing-gown. He also suitably acknowledged the vote of thanks proposed by Mr. Simpson.

The session was then brought to a close and the meeting terminated.

THE ARCHITECT AS ARBITRATOR.

IT is unfortunate for those who are concerned with building contracts that cases involving their interpretation are not more frequently and more regularly reported. In a country where, as here, law reporting is left to chance, the explanation is comparatively simple. As a general rule, building cases are long, dull, and uninteresting. They involve nothing sensational, and are therefore neglected by the daily papers. Further, as each building case involves the discussion of one or more clauses in a particular contract the law reporters generally leave it alone. Although the *Justice of the Peace* has recently shown a tendency to report building cases, important decisions are sometimes unrecorded.

The case of Roberts *v.* Hickman, a report of which has recently been published in a second supplement to "Hudson's Building Contracts," is a useful example of a decision which might have been altogether lost had it not been for the industry of Mr. Hudson. It involved a principle of the first importance in relation to the architect in his position as arbitrator. The facts were very simple. The plaintiffs were suing for the balance of their account for erecting buildings under a contract which was in the usual form. The answer of the employers was that the architect's certificate was a condition precedent. To this the builders replied: "The architect, in withholding his certificate, has not been acting fairly between builder and building-owner. It follows, therefore, that the Courts should allow us to proceed without the certificate."

In the event the House of Lords, which finally decided the case, enumerated the following principle:—

"Where an architect in a quasi-judicial position, *e.g.*, a certifier, does not preserve that attitude of judicial independence needed and required of him to discharge his duties (though he may not be guilty of fraud or collusion), he is no longer fit to be a judge; and in the event of his acting in the interests of the building-owner, or by his directions, the building-owner cannot in such circumstances reply upon the architect's certificate as a condition precedent to payment, or as an adjudication binding upon the builder."

It is important (if the true value of this decision is to be realised) to understand the kind of conduct on the part of the architect to which exception was taken.

Here are some extracts from the letters:—Architect to building-owner: "There is no doubt they (meaning the builders) are entitled to their certificate of practical completion, as the building is now finished and they are giving up possession." Same to same: ". . . . As the builder is entitled under the contract to a certificate, I must, of course, give it to him. . . . I am not issuing any other certificate until the account has been issued and agreed. At the same time, I must express my opinion that I think you are wrong in not agreeing to the certificate I proposed to give, namely, 500*l*." Architect to builder: "I regret I cannot enclose certificate, my clients' instructions being that the certificate I next give you is to be a final one, including for a complete settlement of the work done, into which I shall be prepared to go after Easter. . . . Had you not better call and see my clients, because in the face of their instructions to me I cannot issue a certificate, whatever may be my own private opinion in the matter?"

Founding upon these letters, the builders contended that the architect had really abrogated his functions and had ceased to exercise his proper function between the parties.

Lord Justice Fletcher Moulton, in the Court of Appeal, said:—

"The misconduct on the part of an architect in allowing himself to receive instructions from one of the parties, and to act in that party's interest, goes to the status of the architect. It makes him incapacitated to act as judge, and it is obvious that that affects his decision on every point, and not only on the point on which you can show that he has taken a direction from either side. He is no longer fit to be a judge, because he has been acting in the interests of one of the parties, and by their direction. That taints the whole of his acts and makes them invalid to whatever subsequent matter his decision is directed." In the House of Lords the Lord Chancellor said: "I agree with what Lord Justice Fletcher Moulton said, but would like to add this: It is not, in my opinion, a case to which the terms 'turpitude' or 'fraud' are apt. I think the real error of the architect was that he mistook his position; that he meant to act as a mediator; that he had not the firmness to recognise that his true position was that of an arbitrator, and repel unworthy communications made to him by the defendants. It is undoubted that the defendants, Messrs. Hickman, tried in this respect to lead him astray in their own interests."

The moral is that the architect should be extremely careful about the way in which he expresses himself when writing to either party about the question of certificates.

SOCIETY FOR THE PROMOTION OF HELLENIC STUDIES.

SIR ARTHUR EVANS, F.R.S., presided on Tuesday, at the Rooms of the Society of Antiquaries, Burlington House, over the annual general meeting of the Society for the Promotion of Hellenic Studies.

MR. G. A. Macmillan (Hon. Secretary) read the annual Report, which stated that the most important outside piece of work accomplished under the auspices of the Society during the past year had been the Report of the Committee on the position of Greek in education. The Report made references to the work of the Society for the Promotion of Roman Studies and of the Schools at Athens and Rome. The statement of accounts for the year showed that the expenditure had exceeded the income by 31*l*. The cash balance at the closing of the accounts stood at 701*l*., as against 740*l*. last year. The names on the roll of membership comprised forty honorary members and 915 ordinary members, as against 949 ordinary members last year. The subscribing libraries now numbered 203.

On the motion of the Chairman, seconded by Sir Edward Pears, the report was adopted.

The President, Sir Arthur Evans, took as the subject of his address the persistence of Minoan and Mycenæan elements in Hellenic life, and said that Greek civilisation could no longer be regarded as an *enfant de miracle*. Its roots lay in the older indigenous culture—the Minoan or its later Mycenæan offshoot. Discovery after discovery which the Greeks attributed to themselves could be traced back to their prehistoric predecessors. Summing up the most recent results of researches in the field of Minoan archæology, the President said that the evidence was now clear that from the earliest Minoan Period to the latest there was no break in continuity, and the same must be said of the course of Mycenæan civilisation in Greece, in its origin a purely Minoan creation. The wall-paintings had now supplied us with living representations of the physical aspects of the race which maintained themselves unchanged throughout and were in absolute contrast to any type of Northern invaders. Thanks to the recent discoveries made by the German archæologists at Tiryns of a series of Mycenæan wall-paintings, the record of this old Ægean type could be carried down throughout the whole course of the earlier and later palaces. It was the same at Mycenæ itself. Till the break-up of the Mycenæan dominion in the XIIth century B.C., there was no place for an independent Greek population. Yet the influence of this earlier civilisation on Hellenism could hardly be overrated. Attention was called to striking survivals in religious art, of which the newly-discovered pediment sculptures of the early Doric temple in Corfu afforded an interesting example. The central figure and confronted animals was simply an inheritance from the Mycenæan arrangement. A libation vessel in the shape of a lioness's head found at Delphi, similar to those of the palace shrine at Knossos, showed that the religious foundation there went back to Minoan times. In Crete the instances of religious survival were still more remarkable, and the cult of the Cretan Zeus had finally been transferred to "Christ the Lord." The intensive absorption of Minoan elements had, no doubt, been facilitated by the juxtaposition of Greeks with the older stock for considerable periods and by the bilingual conditions thus resulting. It seemed probable that the primitive Arcadian Greeks had lived in a subject position in the Peloponnese, through, at any rate, a large part of the period of Mycenæan domination. When, on the break-up of this dominion, the Arcadians, then in possession of Laconia, sent out, not later than the XIth century B.C., a colony to Cyprus, we find them already thoroughly penetrated with the old Minoan religion and carrying with them the cult of the Dove Goddess. This fact alone points to long anterior influences.

The poems of Homer belonged to a time when iron was already beginning to supersede bronze for cutting purposes. Mycenæ itself had been long overthrown and its civilisation was already decayed. How, then, is it that in the Homeric poems we find traces of an acquaintance with the courts and palaces of Mycenæan dynasts and with the masterpieces of Minoan art? The explanation in Sir Arthur Evans' opinion lay in the bilingual conditions that preceded the Homeric age. The traditions of an earlier epic—of which illustrations are actually found in Minoan paintings and reliefs—had been in part at least taken over in a translated form, and adapted and reset to the honour and glory of the Achæan race. The personality of Homer himself was only enhanced by this view of his work. It was shown that certain epic passages and incidents had been illustrated by Minoan artists some five centuries before Homer's time. An anticipation of the episode of Scylla attacking a boat was shown to have been represented as early as the XVIth century B.C.

In conclusion, the President pointed out that over and above the direct survival of Minoan and Mycenæan elements in Hellenic life there were at least some traces of a process of revival in the domain of art akin to that observable in Renaissance Italy. A series of early Greek coin-types, notably those of Eretria, seemed to have been directly taken from Minoan gems, and the types of an ivory signet of about 400 B.C. found in Western Crete seem to have been literally borrowed from the signet of some Minoan personage, and represented the costume and armour in vogue a thousand years earlier.

The Hon. Auditors, Mr. Macmillan and Mr. Clay, were thanked for their services on the proposition of Sir J. Sandys, seconded by Mr. F. E. Thompson.

Dr. T. Ashby (Director of the British School at Rome) called attention to the fact that from October 9 to 21 there will be two Congresses in Rome. The Third International Congress of Archæology would meet from October 9 to 16, and there would be twelve sections, dealing with all branches of archæology and the organisation of archæological studies. The archæological exhibition in the Baths of Diocletian would be specially reopened for the Congress. The second Congress which immediately followed was the Tenth International Congress for the Study of the History of Art, which would specially deal with the relations of Italian art to other countries from early Christian to modern times. There would be four sections into which the period of Italian art would be divided.

ROMAN CAMP, AMBLESIDE.

The National Trust invite contributions to a fund of 4,000*l*. in respect of an option of purchase, granted to the Trust for six months, of 20 acres, known as Borran's Field, at the northern end of Windermere and close to Ambleside, forming a scene of great natural beauty. Part of the land has recently been excavated for building purposes, but the owner will suspend operations for six months to come, with a view to the purchase for the Trust, and will give 200*l*. to the fund. On the land is the Roman fort of Borran's Ring, which belongs to the system of roads and blockhouses established in the Lake country, and excavations during the past thirty years have revealed many relics and vestiges of the Roman occupation of the fort and the locality.

GENERAL NEWS.

A Girtin "Discovery."

Messrs. Ernest Brown & Phillips have discovered an interesting collection of hitherto unknown water-colour drawings by Thomas Girtin, and they will be included in their forthcoming exhibition of "English drawings and water-colours, with special reference to the art of Thomas Girtin," which opens to-day at the Leicester Galleries, Leicester-square. All the drawings are in a fine state of preservation as they have never been exposed to the daylight.

Decoration of Olympia.

Messrs. William Whiteley, Ltd., who secured the contract for the decoration of Olympia for the International Horse Show this season, completed the contract within seven days. Among the work carried out was the installing of 5,000 electric lights and 100 arc lamps in the arena. In the Royal terrace and private boxes 5,000 yds. of marbling have been built.

Indian Archæological Department.

The primary function of the Department is the conservation of monuments of historic and architectural interest under the Ancient Monuments Preservation Act, but exploration is undertaken so far as means and opportunity permit. In Bombay about 2,000*l.* was spent last year in repairs to the caves at Elephanta and Junnar and to ancient buildings at Bijapur. In Burma measures were taken to preserve further buildings and sculptures. The excavations of the prehistoric site at Yathemyo were continued. Interesting examples of the Pyu script was discovered. In Madras explorations were carried on in three centres, and five monuments were declared "protected." The Muhammadan monuments at Agra and Fatehpur-Sikri are undergoing conservation. A list of ancient monuments in the Punjab, the preparation of which will occupy a number of years, was begun. Excavations were continued among the important Buddhist ruins of Takht-i-Bahai in the North-West Frontier Province and Kasia in the United Provinces. Various ancient sites around Muttra have been explored, with interesting results.

The Channel Ferry.

In commenting upon the project for connecting England and France by a Channel ferry at the time when Dover was proposed as the British terminal, we pointed out the absolute lack of space at Dover for accommodation of the kind required. It is satisfactory to note, therefore, that in its new form the scheme provides for the establishment of the ferry between Newhaven and Dieppe, a route not only avoiding the difficulty presented by Dover, but also that due to the fact that Calais Harbour is unsuitable for steamers larger than those at present in use. The ferry would undoubtedly be much appreciated in France, but nothing can be done towards the realisation of the project unless the railway companies concerned are able to obtain concessions from the French Government.

London Water Supplies.

Pursuing the wise policy of the old water companies, the Metropolitan Water Board have continually added to the storage capacity of the great system under their control, with the result that the Metropolis is amply supplied with water of excellent quality, notwithstanding the ever-increasing growth of population. As a provision for the future the Board are now about to commence the construction of reservoirs authorised by the Act passed last year. These include two large reservoirs at Littleton and one at Stanwell. At present only one of the former is to be commenced and the others will follow in due course. The three works mentioned will safeguard supplies on the northern side of the Thames for the next two decades. The southern districts also require additional storage facilities, but on a much smaller scale.

The Rebuilding of Piccadilly.

In the House of Commons Mr. Soames, on Thursday last week, asked the Secretary to the Treasury whether the building adjoining the Piccadilly Hotel on the east side, which has been set back, is on Crown land; and, if so, whether he is aware that a front is now being erected which, instead of completing the design of an eminent architect for the elevation to Piccadilly, is of a totally different character, completely discordant with the remainder of the block; whether drawings of this front were submitted to any Government department and approved by them; whether it was the original intention of the Government that, in the rebuilding of Regent-street Quadrant and the block of Piccadilly east of the hotel, there should be a similarity of treatment of the whole façade; and, if so, why that intention has been abandoned; and whether the Government in future will exercise sufficient control over the buildings erected on Crown land to prevent the recurrence of such an unhappy result.

Mr. Masterman, in reply, said the building referred to stands on Crown land held under a lease granted before the hotel was commenced. The Commissioners of Woods had had prolonged negotiations with the various parties concerned, but they are advised that they have no power to prevent the re-erection of the old front. It was the intention that in rebuilding the Quadrant there should be similarity of treatment throughout, but objections had been raised to the original design and the question is now under consideration. No definite design was even settled for the buildings in Piccadilly east of Nos. 19 and 20. In normal cases the Commissioners had full power to control buildings erected on Crown lands. In this instance there is no new building, but only the re-erection of an old façade, removed when part of the former premises were thrown into the street.

Wider Scope for Housing Schemes.

An amendment has been inserted in Clause 4 of Sir A. Griffith Boscawen's Bill for the better enforcement and application of the Housing of the Working Classes Act, which gives local authorities wider powers with reference to the use of land that in the first instance was acquired for the erection of working-class dwellings. The amendment originated in the fact that the London County Council possesses 225 acres at Tottenham only 40 of which have been used for workmen's dwellings. The intention is to give powers to utilise the remainder for houses of a larger type. We think that, as Mr. Burns pointed out, it is most undesirable to create "communities of the rich and parishes of the poor," and that a wider discretion may well be given to the local authorities. We see no special reason for supposing that in this instance the ratepayers' money will be used for the erection of expensive houses for the professional classes which Mr. Booth, who opposed the amendment, seems to consider is "trading of a virulent type."

Church Building Society.

The Incorporated Church Building Society held its usual monthly meeting on the 20th inst., at the Society's house, 7, Dean's-yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at North Finchley, St. Barnabas, Middlesex, 80*l.*; Porthcawl, All Saints, Glam., 150*l.*; Cardiff, St. Stephen, 200*l.*; Loughborough, St. Peter, Leics., 125*l.*; and Winton, St. Luke, Bournemouth, 240*l.*; rebuilding the nave of Speenhamland, St. Mary, Berks, 150*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Groton, St. Bartholomew, Suffolk, 50*l.*; Mutford, St. Andrew, Suffolk, 20*l.*; North Sunderland, St. Paul, Northumberland, 25*l.*; Radnage, St. Mary-the-Virgin, Bucks, 75*l.*; Rathmell, Holy Trinity, Yorks, 10*l.*; Slade Green, St. Augustine, Kent, 2*l.*; and Tyne Dock, St. Mary, Co. Durham, 30*l.* Grants were also made from the Special Mission Buildings Fund towards building mission churches at Frimley Green, St. Andrew, Surrey, 50*l.*; Greenwich, St. Peter, Kent, 30*l.*; and Silfield, St. Helen, Wymondham, Norfolk, 20*l.* The following grants were also paid for works completed:—Beckenham, St. Barnabas, Kent, 50*l.*; Preston, St. Matthias, Brighton, 110*l.*; Plumstead, Church of the Ascension, Kent, 100*l.*; Skirbeck Quarter, St. Thomas, Lincs, 100*l.*; Upwood, St. Peter, near Huntingdon, 10*l.*; Stoke St. Milburgh, St. Milburgha, Herefords, 15*l.*; and Haslingden Grane, Lancs, 25*l.* In addition to this the sum of 205*l.* was paid towards the repairs of fourteen churches from trust funds held by the Society.

Housing Reform.

The twenty-first annual national conference of Charity Organisation Societies was opened on the 21st ult. in Manchester. Mr. J. S. Nettlefold, in a paper on "Slum Reform," said that most of the poor were bound to live in the centre of the city and in meagre accommodation, but they need not live in slums. If the better-off classes were provided for on the outskirts, it ought to be possible to have decent accommodation in the centres. The two main difficulties to contend with were—(1) the condition of the houses and (2) the habits of the tenants. These acted and reacted on each other, and no plan of reform would be satisfactory which did not deal with both sides of the problem; otherwise the untouched side would tend to nullify any improvement in the other. Miss Octavia Hill was the first to put this principle into practice, and her work had been a light to guide all subsequent reformers. But he proposed to deal chiefly with what had been his special work in Birmingham—the reformation of old and insanitary property. The Birmingham Corporation had adopted the policy of calling upon owners to repair their property at their own expense instead of at the expense of the ratepayers. The policy met with much opposition from some owners of slum property, who endeavoured to get off with the least possible expenditure. The methods adopted by these owners were known as "slum-patching," whereas the Corporation insisted on thorough repair. Slum-patching was bad business both for landlords and tenants. Mr. Nettlefold described in detail the alterations which the Birmingham Corporation required to be made in groups of insanitary houses. In the years from 1902 to 1911, he said, the number of houses dealt with was 5,790. Of these 2,819 had been rendered habitable, 2,139 demolished, 80 converted into workshops, and 156 were now undergoing repair; 147 closed courts had been opened to the streets, involving the removal of 358 obstructive buildings. All this had been accomplished at a total cost to the ratepayers, including compensation and administration, of 26,085*l.*, which worked out at less than ½d. rate, and with the majority of property owners and their agents the Corporation were on the best of terms. Birmingham could not claim the credit of being the first to attempt slum reform in this way. She got her inspiration from Hull, Manchester, and other cities. But in some directions she seemed to have gone further than other places, and her work had encouraged others to extend their operations.

Memorial to Alexander Anderson.

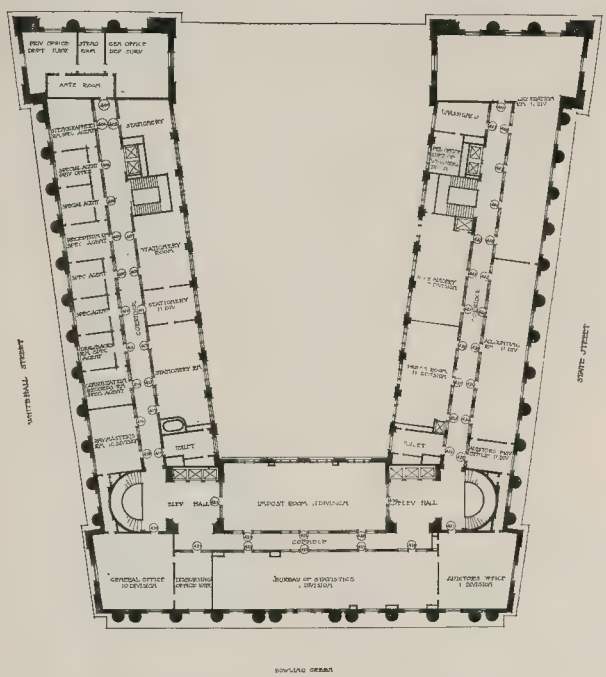
A memorial to Alexander Anderson, the Scottish poet, better known as "Surfaceman," has been erected in the village of Kirkconnel, the place of his birth. The memorial is built of Gatelaw Bridge red freestone, and is 14 ft. in height. In the centre has been placed a bronze medallion of the poet, executed by Mr. H. S. Gamley, A.R.S.A., with this inscription: "Alexander Anderson, 'Surfaceman.' Born 1845. Died 1909. He sleeps among the hills he knew." The monument stands in a picturesque spot near the village churchyard.

COMPETITION NEWS.

A list of current Competitions is printed on page 776.

Port of London Offices.

The designs of Mr. Robert Atkinson, Messrs. Bowden & Wallis, Mr. Edwin Cooper, Messrs. Lanchester & Rickards, Mr. J. R. Truelove, and Mr. E. W. Wray are due to be sent in on Monday next. Sir Aston Webb's report on the final competition will be awaited anxiously by the competitors and with interest by the rest of the profession.



Public Offices, Lymington.

The first premiated design in this competition is by Messrs. Newby Vincent & Findlay Smith, Prudential Buildings, Above Bar, Southampton. The second premiated design is by Messrs. Aldridge & Thomas, Hinton Chambers, Bournemouth. Mr. R. F. Gutteridge, A.R.I.B.A., was the assessor.

Mural Decorations, Crosby Hall: Additional List of Awards.

The following awards have been made in addition to those announced in our last issue (p. 722):—

Church of St. Jude-on-the-Hill: Hampstead Garden Suburb.—Miss Mabel Esplin is the

United States Customs House, New York: Third Floor.

Mr. Cass Gilbert, Architect.

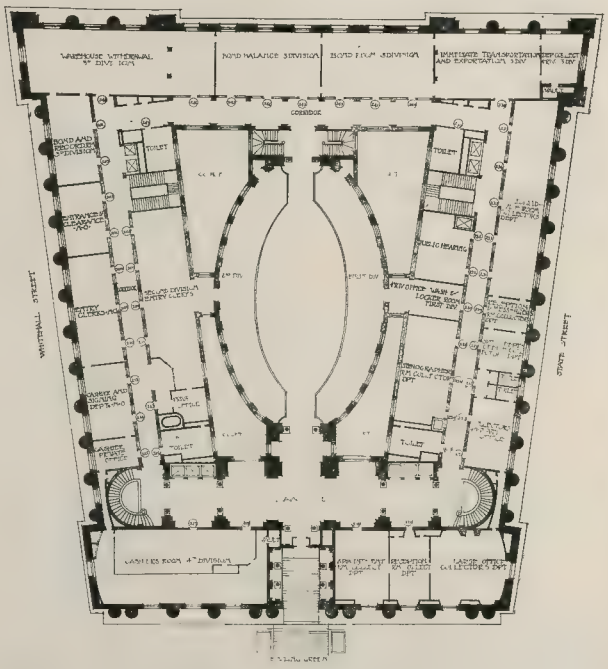
winner of this competition. The building is by Mr. Lutyens, and 50*l.* was available when the conditions were published.

Sutton Valence School, near Maidstone, Kent.—Mr. George Haghe Day is the successful competitor. The new building is by Messrs. Adams & Holden, and the Governors voted 25*l.*–50*l.* for the execution of an approved design.

Stencil Pattern for Dado Border.—5*l.* 5*s.* was offered anonymously for a stencil pattern of a lively figure-subject. Mr. T. A. Godfrey has been declared the winner of the prize.

Colwall Sewage Disposal.

In the recent limited competition for the sewage disposal of Colwall, near Malvern, the scheme submitted by Messrs. Taylor & Wallin, of Newcastle-upon-Tyne and Birmingham (Mr. Harry W. Taylor, A.M.Inst.C.E.), has been premiated, and they have now been engaged as engineers for the execution of their scheme. The disposal works will be on modern bacterial lines.



Proposed Public Baths at Balham.

The Baths and Washhouses Committee of Wandsworth Borough Council report having further considered the conditions of competition for the design of the proposed baths at Balham, and state that they are unanimously of opinion that competitive designs should be invited and that an assessor should be appointed. At the meeting of the Council last week Councillor Anderson moved that the following recommendation of the Committee adopted at a previous meeting of the Council should be rescinded: "We have considered the subject of the preparation of plans for the proposed baths at Balham, and recommend that architects be invited to submit competitive designs for a suitable building." He further moved "that the Borough Engineer be instructed to prepare the necessary plans and specifications for the proposed baths at Balham and to supervise the work." In moving the resolutions Councillor Anderson said his case was that the Borough Engineer could very well be the Council's architect. He had prepared plans for the baths on Tooting Common, and there was not very much difference between the baths on the Common and the baths under discussion. If they took the Engineer as architect they would save 450*l.* on each of the baths they constructed. Here they had a man who was a competent architect, who had made buildings for them of which they might be proud. He could do the work if they gave him the proper assistance. Alderman Lorden, in supporting the Committee, said that their Engineer was a man who attended to the roads and sewers and his other work splendidly, but he did not pose as an architect. If they put the work of the baths in his hands immediately he would have to get an architect into his office, and it seemed to the speaker to be an insult to the profession to say that they were going to get the right man for three guineas a week (as was suggested by Councillor Anderson). They could not get a man to assist the Engineer under six guineas, and then the Council would be setting up an architect's department, which would not be desirable. Councillor Evershed said Councillor Anderson had stated there was very little difference between the open-air baths on Tooting Common and the baths they were about to build. Was he aware that the contents of those baths would be 96,000 gallons of water, and that one of the most serious questions they had to face was that of percolation? Although they had cement and glazed bricks yet a certain amount of water did get through. He (Councillor Evershed) would advise all the Councillors to go to the Wandsworth Baths and to go under the building in order to see the yards of piping there were beneath the building. Tooting baths had nothing of the kind. There was another point to show the difference between the two baths. Councillor Anderson seemed to forget that at the open-air baths there was absolutely no engineering, whereas in connexion with the baths they were about to erect one-third of the money would be spent in engineering work. On being put to the vote only two voted in favour of the rescision. The Committee's recommendation was then carried.

Stockport Union: New Wards.

In the limited competition for mental wards at Stepping Hill Infirmary, Stockport, the following are the awards:—

First premium, Messrs. Edwin T. Hall,

United States Customs House, New York: First Floor.

Mr. Cass Gilbert, Architect.

F.R.I.B.A., and E. Stanley Hall, A.R.I.B.A., London. Second premium, Mr. Arthur Marshall, A.R.I.B.A., Nottingham. Third premium, Messrs. Reginald H. Spalding, A.R.I.B.A., and Ernest G. Theakston, Lic.R.I.B.A., London.

The drawings will be on view at Pendlebury Memorial Hall (Dodge-hill entrance), Lancashire-hill, Stockport, until 29th inst. inclusive, between the hours of ten and five.

CUSTOMS HOUSE, NEW YORK.

IN our issue of January 12, in an article on the work of Mr. Cass Gilbert, we referred to the plan of the New York Customs House as one of the few really great plans which are conceived at fairly long intervals in various parts of the world. We were not able then to illustrate these plans, but through the courtesy of Mr. Cass Gilbert we now publish those of three of the principal floors.

BOOKS.

Building Structures in Earthquake Countries. By ING. ALFREDO MONTEL. Forty-two diagrams and one plate. (London: Charles Griffin & Co., Ltd. 1912. Pp. 127. 8s. 6d. net.)

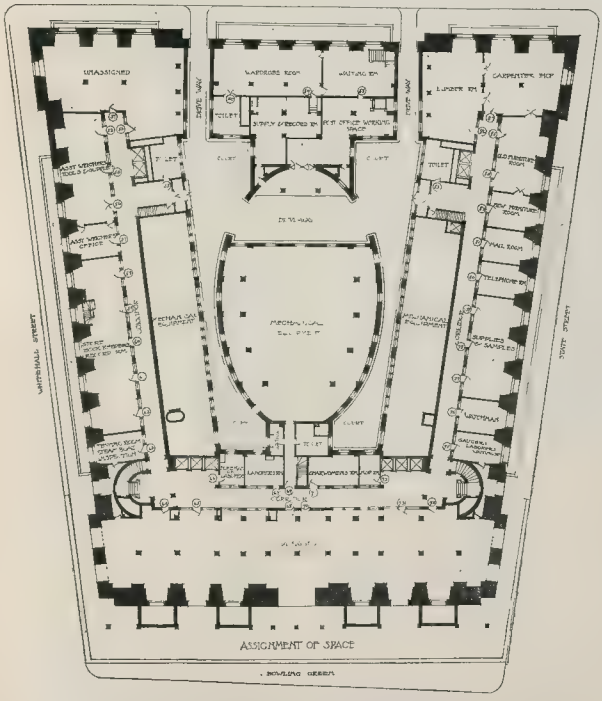
TRANSLATED from his Italian book and including some additional matter by the author, this work is an excellent survey of the subject to which it is devoted. Earthquakes in general, and the earthquake of Calabria and Sicily in particular, are discussed with special reference to building construction. Japanese regulations for the design of earthquake-proof timber buildings are summarised, and particulars are given of Japanese investigations into the resistance of brick columns to the effects of horizontal movements and shocks. Different methods of designing earthquake-resisting buildings are considered, and, above all, attention is paid to brick and reinforced concrete construction. The advantages of monolithic buildings are emphasised, and the author points to the fact, established by the Calabro-Sicilian earthquake, that reinforced concrete houses are very well able to resist earthquake shocks. He is not quite correct in stating that the same fact was proved by the San Francisco earthquake of 1906. It is true that reinforced concrete floors and other structural details and one partly completed building existed in that city at the time of the disaster; but there were no reinforced concrete buildings, for the simple reason that this type of construction was not permitted by the local building code. The structure mentioned as partly completed was being erected at the owner's risk in defiance of regulations in the hope that it would be passed after completion. However, this misconception on the part of the author in no way detracts from the general value of his book, which will be appreciated by architects in earthquake countries, and may also be found useful to many of our readers who are called upon to design buildings in places where the soil is of unstable character or has been undermined by colliery workings or brine-pumping operations.

Everybody's Guide to the Insurance Act. By THOMAS SMITH, Barrister-at-Law. Second Edition. (London: Charles Knight & Co. 1912. 357 pp. 1s. net.)

THIS is a wonderful shilling's-worth. We have here an introductory chapter, an explanation of the Act, the text of the Act, and an index, 357 pages of clear type, but readers must not expect to find any treatise on this Act easy reading. On his title-page the author quotes from a speech of Mr. Balfour in the House of Commons:—"This is the most complicated Bill of the last 100 years, and it touches more sets of people in more obscure and unanalysable ways than any measure that has ever yet been tried"; but the author approaches his work in no hostile spirit. He says, "The object of this handbook is by no means to criticise. Even if it were, a far greater measure of praise possibly than of adverse criticism would be afforded to the proposals . . . " yet he is alive to the drawbacks attending such a measure, and his introductory remarks contain some very shrewd observations on the effect the Act may have upon wages, hospitals, friendly societies, and thrift generally. This edition completes the sixtieth thousand, and this fact speaks for itself. If we may venture to offer any suggestions for future editions, we should like to advise the printing of all the regulations issued under the Act in order in the Appendix after the text of the Act. There are some regulations made under sect. 91, Part II., of the Act for obtaining the decision of the umpire upon whether contributions are payable in respect of certain classes of persons which we have been unable to find. A reference to a particular section of the Act is also sometimes difficult to discover in the text.

Hunt's Law of Boundaries, Walls, and Fences. Sixth Edition. Revised and substantially re-written by R. G. NICHOLSON COOMBE, M.A., LL.M., Barrister-at-Law. (London: Butterworth & Co. 1912. Pp. 262. 15s.)

THE last edition of this work by Mr. Henry Stephen appeared in 1904; the present editor has, he states, substantially re-written the work, and we find in its pages the same lucidity of style which characterises his work on "The Law of Light." This treatise also appears to us admirably arranged with headlines to attract the eye and a clear text, with the cases in footnotes. There is a table of cases with the references to all the Reports and an Index. There is a chapter on party walls, also on the right of support for land and buildings, and the various kinds of boundaries are dealt with, including water boundaries and the foreshore. This volume will not only prove useful to the legal profession, but is a valuable guide on a complicated branch of the law with which many persons find themselves concerned, and the subject is presented in an attractive form easily comprehended.



BOOKS RECEIVED.

THE PREPARATION AND USES OF WHITE ZINC PAINTS. By Paul Fleury, translated from the French by Donald Grant. (London: "The Oil and Colour Trades Journal." 6s. net.)

THE GREAT STATE. Edited by H. G. Wells. (London: Harper & Brothers. 6s. net.)

MAGAZINES AND REVIEWS.

The *Contemporary Review* contains an interesting article by Mr. Lisle March Phillipps, whose name should not be unknown to those interested in architectural criticism, entitled "The Gothic Ideal." "There are," says Mr. Phillipps, "two distinct methods of estimating a great architectural style. The first, which is the method in vogue with professional architects, and which, indeed, may be said at the present time to be the only method generally adopted, is to concentrate attention on, and confine it to, the peculiarities of a group of buildings, to analyse the forms employed, their derivation, combination, and development, and to assure the reader that the essence of the style and its animating principle are to be sought in the structure itself, which, by a process of inevitable evolution, has taken the shape we see. The second method is to treat the structural features of a given style as outward and visible manifestations of certain racial or national characteristics, the chief value and chief interest of such features consisting in the light they throw upon those human attributes and the vivid portraiture of them which they produce." The author proceeds to examine the Gothic ideal from the second standpoint. We publish a note upon his view of the matter on page 750.

United States Customs House, New York: Basement.
Mr. Cass Gilbert, Architect.

BRISTOL MASTER BUILDERS' ASSOCIATION

The annual summer excursion of this Association took place on Wednesday, the 19th inst., when among the places visited were Totnes, Dartmouth, Paignton, and Torquay. The dinner was held at the Queen's Hotel, Torquay, Mr. Audley Perkins, President, in the chair.

EDITORIAL SUMMARY.

The leading article deals with some considerations on "Education and Style in Architecture."

The second article is upon the French Architectural Societies—"Association Provinciale des Architectes Française" (p. 748).

A short article on the late Sir L. Alma-Tadema, O.M., R.A., appears on p. 749.

In "Notes" columns (p. 750) will be found comments on: "Freedom of Labour and in Life"; "The Craftsman and His Work"; "Mr. Stokes's Portrait"; "Methods of Business and Architecture."

Another of our articles on "Contemporary Architects" is given on p. 751, where an appreciation is given of the work of Mr. Basil Champneys, the Royal Gold Medallist this year of the Royal Institute of British Architects.

A meeting of the Royal Institute of British Architects was held on Monday, when the Royal Gold Medal for the promotion of architecture was awarded to Mr. Basil Champneys for his executed works as an architect. At the same meeting the portrait of the retiring President, Mr. Leonard Stokes, was unveiled (p. 756).

A short report of the meeting of the Society for the Promotion of Hellenic Studies appears on p. 758. The President, Sir Arthur Evans, delivered an address.

In Correspondence Column (p. 762) will be found a letter on: "Timber Specifications."

The Monthly Illustrated Review of Engineering p. 763, contains: "Immingham Dock, Grimsby"; "Poured Concrete Houses"; "Asbestos-Wood"; "Railless Tramcars"; "Passing of an Ancient Bridge"; "Novel Suggestion for a Bridge"; "Gantry for H.M. Stationery Office."

The Building Trade Section (p. 769) includes: "The Insurance Act"; "Builders and Fire Insurance"; "Concrete-Mixers"; "Fees for Specifications"; "Government Contracts"; "Projected New Buildings in the Provinces," etc.

In Law Reports (p. 774) will be found: "Padbury *v.* Holliday & Greenwood"—subcontractors and liability of contractors; "Wilkinson *v.* Shorrock"—contractor's successful appeal; "Denman *v.* Finchley Urban District Council"—builder's action.

MEETINGS.

SATURDAY, JUNE 29.

Institution of Municipal and County Engineers.—North-eastern district meeting, Bridlington.

Edinburgh Architectural Association.—The annual excursion, to Durham.

TUESDAY, JULY 2.

Society for the Promotion of Roman Studies (Rooms of the Society of Antiquaries, Burlington House, W.).—Mr. G. H. Stevenson, M.A., on "The Light Thrown on Roman Scotland by the Excavations at Cappuck, near Jedburgh, in 1911-1912." Lantern illustrations. 4.30 p.m.

JULY 4, 5, AND 6.

Liverpool Architectural Society (Incorp rated).—The Architectural Associations of London and Dublin will visit Liverpool on Thursday, Friday, and Saturday It has been arranged by the Council to entertain the visitors to a supper, to be held at the University Club, on the evening of Saturday, July 6, at 8 p.m.

ARCHITECTURAL SOCIETIES.

Bristol Society of Architects.

The second monthly sketching expedition in connexion with the Bristol Society of Architects took place on Saturday last week. Whitchurch was first visited, and after inspecting the church an hour was allowed for sketching and measuring. The church, which was originally cruciform in plan, contains many points worthy of study. The central tower, carried upon Norman arches, is a feature rarely seen in Somerset, and the early XIVth-century windows in the north transept and chancel are excellent examples of the period. Upon leaving Whitchurch the members proceeded to Publow, where they were received at the church by the vicar, the Rev. H. J. Ker Thompson, M.A., who gave a description of the building and an account of the restoration work accomplished and still in progress. The glory of Publow is the fine XVth-century tower with its excellent masonry of squared and tooled limestone. The south porch also calls for attention, and in addition there are one or two architectural and archæological problems calculated to produce discussion. On the return journey a halt was made at Pensford, where there is a fine specimen of an XVIIIth-century mahogany Communion table.

CORRESPONDENCE.

Timber Specifications.

SIR,—As the writer of "Building Timbers and Architects' Specifications" I wish to thank you and your correspondents for your friendly reference to that book, and to echo your hope, expressed in your editorial note, that practical good will be done by the discussion in your columns.

It is becoming obvious, however, that there is a greater evil than the vague and obsolete specifications against which "Building Timbers" was largely directed. That is the substitution of new clauses based upon limited information, conveying an illusory suggestion of up-to-date knowledge, which really hamper the builder in greater degree than the old formulæ.

There is all the difference between mentioning two or three shipments as a standard of quality and specifying those shipments alone.

Your correspondent, Mr. B. E. Laine-Pearson, has been well advised in some respects as to the brands and shipments which he specifies. They are all usually very good. But what is the builder to do when those shipments are not up to their usual standard, or when they are not available at all? The shippers are not like local shopkeepers who can deliver across the counter on demand. For many months in the year their output may not be represented, and even if they sent their whole cutting in any given year there would not be anything like enough of their higher qualities to go round if this specification were adopted.

I advise the building trade to resist strenuously any limitations to brands or shipments, as putting a fictitious value on goods which are no better than many competing varieties.

Let me say, too, that where freedom from blemish is required, deal is not a suitable wood to specify. Even the finest shipments contain centres, sapwood, and knots. If an architect secures for his client the saving in cost implied by the use of a moderate priced material like deal he cannot expect the perfection of finish yielded by woods which are 200 to 400 per cent. dearer. Where deal is necessary the builder and timber merchant can but do their best with the material at their command.

I make bold to submit the following as a fair and reasonable clause for governing deal used in carpenters' work (shown on p. 162 in "Building Timbers").

'Wood for carcassing or carpentry shall be as follows:—

"Sizes 4 by 12 and under; sound, bright, square-edged.

"Baltic or White Sea red or yellow.

"Larger sizes to be sawn from prime pitch-pine or Oregon or British Columbian pine or White Sea larch."

"Sizes 2 in. to 3 in. thick by 4½ in. or less in width to be sawn out of larger imported dimensions."

If the words "sound, bright, square-edged" are not regarded as sufficient protection, and a standard is required, the words, "Equal to Kemi brand" would meet the case.

I cannot expect you to devote your valuable space to a detailed discussion covering joinery and hardwoods, so select the wood for carpenters' work as the item around which most of the troubles centre.

Hoping to hear that the official bodies are moving in the matter in the near future.

JAMES DAVIES.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday, in the County Hall, Spring-gardens, S.W., Lord Cheylesmore, Chairman, presiding.

Town Planning.—The General Purposes Committee submitted a report in which they stated that the Clerk and the Architect of the Council had attended a meeting in connexion with the intention of the Acton Urban District Council to apply to the Local Government Board for authority to prepare a town-planning scheme in relation to lands lying in the parish of Acton and adjoining parishes.

Sessions House.—A report was submitted by the Local Government Committee recommending the building of a new Sessions House on the site of the Newington Sessions House at an estimated cost of 100,000*l.*

Tivoli Music Hall.—The Theatres and Music Halls Committee stated that drawings had been submitted by Messrs. Wylson & Long for the reconstruction of the Tivoli Music Hall, Strand. Seating accommodation is shown to be provided for 1,580 persons.

ILLUSTRATIONS.

Buildings by Mr. Champneys.

THE work of the Royal Gold Medallist for 1912 is illustrated this week, and the plates are supplemented by a new portrait of the distinguished architect. The new Bedford College, Regent's Park, is in progress and will form a notable addition to the buildings erected by Mr. Champneys.

Bedford College.

The college originated in 1849 in a single house in Bedford-square, but, through the enterprise of the late Mrs. Jesser Reid, the institution prospered rapidly, and it has now a large share in promoting the higher education of women. The Treasury grant is 7,000*l.* a year. The Baker-street building has long been inadequate for the needs of the College, and in 1903 the Governing Body started a Building and Endowment Fund. Up to the present 121,000*l.* has been received, that sum being made up, partly, by donations of 30,000*l.* from an anonymous gentleman, 20,000*l.* from the London County Council, 11,500*l.* from the late Mr. R. J. Turle, and 6,000*l.* from the Goldsmiths' Company. Ten thousand pounds was given anonymously to provide a dining-hall, and 10,000*l.* was given by Lady Tate for a library. The latter building is being erected from designs by Mr. Sidney R. J. Smith, F.R.I.B.A.; otherwise the new Bedford College will be the work of Mr. Basil Champneys.

About 18,000*l.* was spent in acquiring a Crown lease of the site (11 acres) in Regent's Park, and such progress has been made with the buildings that it is hoped they will be ready for occupation in the early part of next year. Questions were asked in the House of Commons on Tuesday, to the end that no further buildings should be erected in Regent's Park without Parliamentary sanction.

FIFTY YEARS AGO.

From the *Builder* of June 28, 1862.

The State of Russia.

A CORRESPONDENT of the *Siècle*, writing from St. Petersburg, gives an account of the acts of incendiarism in that capital, so terrible as to recall the times of the Jacquerie, and to lead to the question whether this, bad as it is, be not the beginning of a general outbreak of savage vindictiveness threatening to involve society in desolation. During the preceding fortnight, or say the first half of June, fire succeeded to fire in every direction, spreading such devastation that the value of property consumed is estimated at 100,000,000 of roubles. In one fire 500 houses were burned. Another set a whole faubourg in flames. A third consumed eighty houses in a different faubourg. The telegraph was set to work to call assistance from Moscow, and the answer was that Moscow was burning too! The most serious loss appears to be that caused by the destruction of a bazaar containing 2,000 shops filled with merchandise, and which is now a heap of ruins. By this ruin of property 200,000 persons are thrown on the streets. It was on Whit-Monday that the bazaar was destroyed. Other towns besides St. Petersburg and Moscow have also been set fire to

General Offices, Immingham, Grimsby.

IMMINGHAM DOCK.

SITUATED on the southern shore of the wide estuary, somewhat inappropriately designated the River Humber, the new seaport created at Immingham by the Great Central Railway Company is about 6 miles west of Grimsby and some 9 miles east of Hull.

The establishment of a new port between Hull and the open sea is merely a phase of the eastward movement that has been taking place on the Humber for many years past.

The increasing size of steamships long ago pointed to the necessity of providing better dock accommodation at Hull, and, as the old docks could not be brought into line with modern requirements, new works of the same character have been inaugurated on the eastern borders of the port, where a greater depth of water prevails.

The development of Grimsby, still nearer to the North Sea, was another evidence of the eastward movement, which is further denoted by the enterprise briefly considered in the present article.

Five years ago the site of the Immingham Dock estate formed part of a wide stretch of marshland lying between the village of Immingham and the brown waters of the Humber.

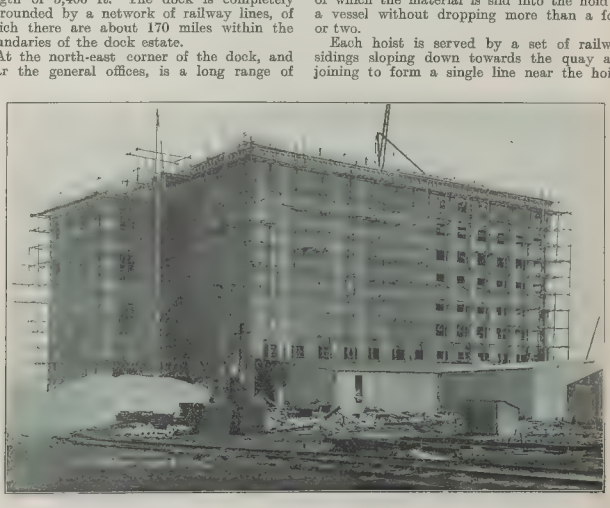
To-day the visitor finds it occupied by docks, jetties, quays, railways, and all the accessories of a modern seaport, situated in a land-locked harbour, with a deep-water channel available for the largest ships afloat at all states of the tide.

From the entrance gates of the new dock two long jetties project into the deep-water channel. One of these, on the eastern side, is intended for passenger traffic, and on it is built a railway-station in communication with the Great Central Railway system. The other jetty is devoted to the shipment of bunker and cargo coal, transported along a viaduct terminating at a coal hoist on the main jetty and capable of delivering coal at the rate of 500 tons an hour into vessels moored alongside.

The two jetties provide a V-shaped area of still water outside the entrance gates, thus protecting vessels from the side sweep of the current.

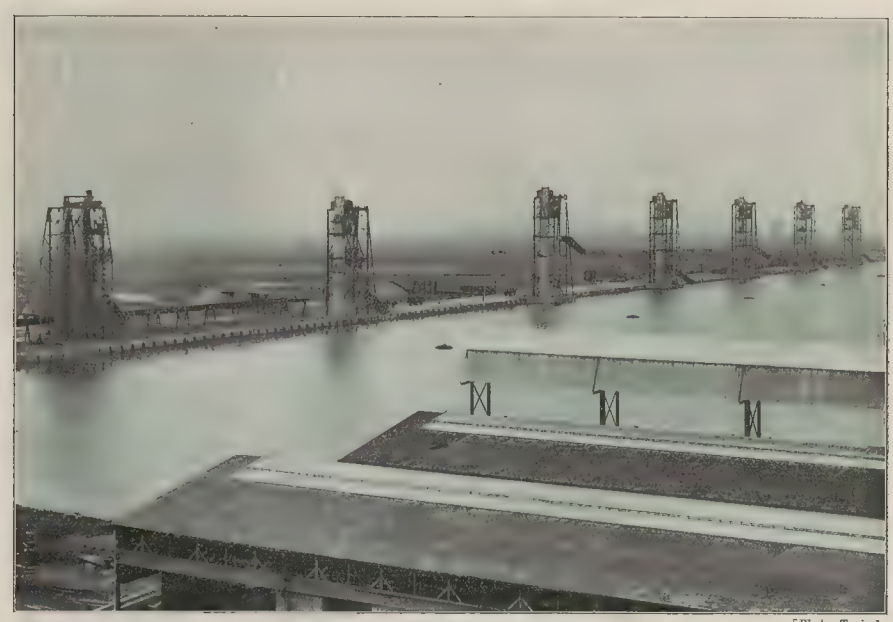
The entrance lock is 840 ft. long by 90 ft. wide, with the depth of 27 ft. 6 in. at low water and 47 ft. at high water. In addition to the gates at either end there is a pair of gates at the middle of the lock to enable vessels of moderate size to be handled conveniently and economically.

At one side of the entrance lock are the general offices, and along the other side is a graving dock 740 ft. long by 56 ft. wide and 23 ft. deep from sill level.



As at present developed the main dock comprises a basin 1,100 ft. square, with two arms on the western side, each measuring 1,250 ft. long by 375 ft. wide.

The total water area of the dock is about 45 acres, and the quays extend to the collective length of 5,400 ft. The dock is completely surrounded by a network of railway lines, of which there are about 170 miles within the boundaries of the dock estate.



At the north-east corner of the dock, and near the general offices, is a long range of single-story transit sheds; at the eastern end are another range of sheds and a large granary building with elevator and machinery of the latest types for handling grain; along the southern side of the main basin and the south-west arm there are seven hydraulic coal hoists, six stationary and one movable, so that coal can be delivered into two holds of a vessel moored to the quay; and along the outer sides of the north-west arm extensive yards are provided for the storage of timber.

To avoid the breakage of coal as it is discharged the hoists are constructed with a system of radial extension shoots, by means of which the material is slid into the hold of a vessel without dropping more than a foot or two.

Each hoist is served by a set of railway sidings sloping down towards the quay and joining to form a single line near the hoist.

New Granary and Silos for the Great Central Railway Company: Constructed in Ferro-Concrete.

[*Photo. Topical.*

Elevated View showing Seven Coal Hoists.

The full trucks running by gravity down to the quay are hoisted one at a time, and the coal is tipped out by hydraulic machinery.

The empty trucks are then placed on the line carried by an overhead gantry, whence they gravitate to the tracks where empties are made up into trains.

Each of the seven hoists has eight gravity sidings with room for 320 loaded trucks containing 3,200 tons of coal ready for discharge, the hoists being able to deal with nearly 5,000 tons per hour.

Behind the gravity sidings are two yards for full and empty trains, the latter leaving by independent lines so that they shall not get in the way of full trains.

Accommodation is provided for the storage of 174,000 tons of coal on the dock estate.

For the mechanical handling of materials generally numerous cranes have been installed, including five 30-cwt. cranes for timber, ten 3-ton and two 5-ton gantry type cranes on the south-west arm, a 50-ton crane with luffing jib on the western quay, six 2-ton and one 10-ton crane on the north-east quay, and a similar equipment on the eastern quay.

In the construction of the dock some 3,500,000 cubic yds. of earth were excavated, this material having been utilised for the purpose of raising the level of the surrounding

[*Photo. Topical.*

View under Movable Hydraulic Coal Hoists, from South Quay.

land, and similar use was made of mud dredged from the bed of the estuary near the approach jetties.

Among the buildings erected on the dock property are :—The general office building, transit sheds, bonded stores, dining-rooms, granary building, locomotive sheds, power-station, and passenger-station.

The power station was built by Messrs. H. Arnold & Son, of Doncaster, and includes accommodation for steam boilers, hydraulic pumping engines, and electricity generating plant.

Eight Lancashire type boilers, 30 ft. long by 8 ft. 6 in. diameter, have been laid down, the flues leading to a cylindrical chimney-shaft, 200 ft. high, with the interior diameter of 7 ft. 6 in. Separate engine-rooms are provided for hydraulic and electrical machinery, and the power-house building includes workshops for repairs.

The hydraulic-power accumulator house is in the form of a brick tower on the western side of the power-house.

The granary building, previously mentioned as being situated at the eastern end of the main basin, is a reinforced concrete structure measuring 137 ft. by 128 ft. in plan, and was erected by Messrs. Stuart's Granolithic Company, Ltd., of London (see p. 763).

We are informed that reinforced concrete has also been employed for the construction of various bridges and viaducts for railway lines on the dock property, these having been constructed by the Yorkshire Hennebique Contracting Company, Ltd., of Leeds.

At the present time the new seaport of Immingham is quite in its infancy, having only recently been opened to traffic and still awaiting the inaugural ceremony to be held under the auspices of the King on July 22 next.

If we may judge by the history of Grimsby, the new port should provide ample scope for building operations. The situation is one very suitable for the establishment of factories, being near the coalfields and in touch with the railway and canal systems of Great Britain, while the sea affords means of communication with other countries.

It is stated that plentiful supplies of building material are available and that clay for brick-making purposes is at hand in large quantities.

POURED CONCRETE HOUSES.

OUR readers are already familiar with the proposal made by Mr. Thomas A. Edison that dwelling-houses for workmen and others might be economically constructed in one piece by pouring concrete of special composition into a single mould previously erected.

Very little has been heard recently of this proposition, but it is of interest to note that Messrs. Small & Harms, of 12, Rue du Mont-Thabor, Paris, are working upon the same idea on practical lines.

Mr. Small is an American engineer and Mr. Harms a Dutch structural engineer who has lived for ten years in the United States, and both of them were formerly colleagues of Mr. Edison.

These engineers have patented the method of construction described in this article, and two companies have been formed for the purpose of working the patents—the Monogram Construction Company, of Santpoort, Holland, and the Société Française de Maison and Constructions Moulées, of Paris.

The first poured concrete building constructed, or, as one may appropriately say, cast on the Small-Harms system is a small house at Santpoort, a seaside resort near Haarlem.

The building covers an area of 39 square metres, and comprises six rooms on two floors. The cost is stated at 1,800 guilden (144*l.*), which is very reasonable in view of the relatively high cost of materials in Holland.

As may be seen by the photograph reproduced in Fig. 1, the design has been kept exceedingly simple, so that it is well adapted for a concrete structure. The entire absence of meaningless details facilitates the construction, and at the same time tends towards breadth and simplicity in design, while the character of the building is aided by the uniform tint of the concrete, which remains as left by the moulds.

The roof is flat and finished by a simple cornice, and round the house is a terrace in concrete raised a few inches above normal ground level.

As a pleasing contrast to the even tone of the walls, the doors and windows are painted in bright colours, which constitute the only decorative treatment on the exterior.

The house was designed by Mr. H. P. Berlage, the architect of the new Exchange in Amsterdam, which is a good example of unadorned brick construction.

A serious problem demanding solution before the idea of casting entire houses could be practically realised was the need for obviating the separation of the materials in the concrete during the operation of pouring.

This difficulty was overcome by Messrs. Small & Harms by the addition of colloidal material, which, used in small quantities, has the effect of increasing the viscosity of the concrete, while facilitating its flow into all parts of the moulds and obviating the segregation of the constituents.

The fluidity of the concrete employed may be gauged by the statement that the quantity of water by volume ranges from 120 to 175 per cent. of the volume of cement used, or from three to four times the customary amount.

The concrete was mixed in the proportions of 1 part Portland cement, 3 parts sand, and 2 parts gravel.

It will be noticed that, contrary to customary practice, the quantity of sand is far greater than that of the aggregate, the reason for this being the necessity of making the concrete exceptionally fine and close-grained.

Fig. 1. View of Completed House.

Fig. 2. Mould Ready for Concrete.

The patentees claim that the colloidal substance added to the concrete makes the latter flow almost as readily as water. In fact, it is stated that the concrete will flow upon a floor surface inclined at two degrees, or upon itself at an inclination of half a degree, without the evidence of any tendency to segregation.

These contentions appear to be confirmed by the appearance of the house at Santpoort, where the exterior and interior surfaces show the concrete to be of uniform texture and colour and as smooth as if finished by trowelling.

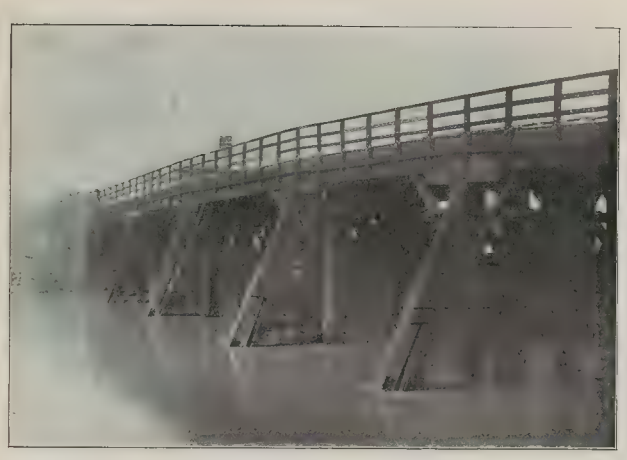
Moreover, the surfaces are perfectly plain and the angles well defined, thus denoting the rigidity of the moulds under heavy pressure, which in this case reached the maximum due to a column of concrete 6 metres high.

Thanks to the fluidity of the mixture, the concrete can be poured in from one point of the mould, flowing thence to every part of the building to be cast.

It would be quite possible to pour the floors and flat roof at the same time as the walls and other details. But this would necessitate keeping the moulds in position long enough to permit the concrete to harden until capable of supporting its own dead weight.

As this might prove inconvenient the patentees have adopted the alternative of employing slabs of suitable length, width, and thickness, and of fixing these in place, while the moulds are being erected, to form floors and flat roofing. The same practice is followed in construction of stairs. The result is that the general moulds can be taken down two days after the concrete has been poured.

Chimney flues and other stoneware pipes are enclosed in the moulds and embedded in the concrete subsequently poured in.



The rapid construction rendered possible by this new method of building is indicated by the statement that the erection of moulds for a small house usually occupies about eight days, the pouring of the concrete six hours, and the removal of the moulds two days after pouring occupies two days, making a total of thirteen days for construction.

Foundations, however, are presumed to have been constructed in advance, with or without cellars. It may be pointed out in this connexion that the rigidity of the superstructure, its ability to act as a single unit, and the relatively small dead weight due to the thinness of the walls, make it possible to reduce the foundation work considerably, and it is believed that poured concrete houses can be constructed on the notoriously unstable soil of Amsterdam without the aid of foundation piles as universally employed up to the present.

The mould in which the house at Santpoort was cast consisted of some 2,600 castings of size and weight convenient for handling, and assembled by about 10,000 bolts and nuts.

Fig. 2 is from a photograph taken when the mould had been erected ready for the pouring of the concrete. It should be noted that the units can be employed, after the fashion of children's building blocks, in numerous combinations as required by designs for large or small buildings.

The initial outlay involved in the provision of the mould is heavy, as may be judged by the statement that the moulds for the house at

Wooden Trestle Bridge at Cressage.

Santpoort cost 15,000 gulden (1,200*l.*), but it must be remembered that the castings are practically everlasting, and can be used so many times that the charge per building becomes a very small item.

Since the foregoing was written we have been informed that the first house on the Small-Harms system in France was poured on May 9 last, in the Rue de Montjoie, Paris, by the Société Française de Maisons et Constructions Moulées.

ASBESTOS-WOOD:
A NEW REFRACTORY BUILDING MATERIAL.

IN a recent paper read to the American Society of Mechanical Engineers Professor Norton discusses methods of treating wood so as to increase its resistance to fire, and describes a new building material invented by himself and designated asbestos-wood.

Some of the processes hitherto adopted for the treatment of timber involve saturation with a chemical solution which on drying leaves in the pores a salt capable of giving off a gas when heated, the gas being of such nature as to be incapable of supporting combustion.

Given thorough saturation, the protection afforded is very considerable, and the durability of the wood is increased.

In other processes the timber is impregnated with chemical solutions intended to encase the fibres with a solid refractory substance, a method of treatment which has also proved to be satisfactory in practice.

As an alternative to natural wood treated chemically, Professor Norton proposes a kind of artificial wood composed of two elements a fibrous substance and a cementitious material—the former consisting of asbestos and the latter of magnesium oxide or calcium silicate and aluminate.

Professor Norton claims that his asbestos-wood is practically incombustible, harder than natural wood, has a transverse strength about two-thirds that of white pine with the grain, and, without being brittle, an elasticity less than that of natural woods, and heat conductivity of between 30 and 50 British thermal units per square foot per twenty-four hours per degree Fahrenheit.

The weight of asbestos-wood 1 in. thick ranges from 8 lb. to 13 lb. per square foot, equivalent to from three to four times the weight of white pine.

Test specimens, 12 in. long by 12 in. wide by ¼ in. thick, supported on two knife-edges 11 in. apart, were found to break under the centre load of 200 lb., while white pine similarly tested broke under a load of 300 lb. with the grain and 20 lb. across the grain. The equality of strength in both directions possessed by asbestos-wood is a feature that in some cases is of great advantage.

The absorption of water by asbestos-wood varies between 4 and 20 per cent., and prolonged immersion in fresh water appears to cause no injury.

The coefficient of expansion is said to be about 0·000004 at ordinary temperatures, diminishing rapidly at 700 deg. Fahr., and becoming negative at 950 deg. Fahr., when shrinkage commences.

Boring, sawing, and finishing are naturally more difficult than in the case of natural wood. The new material withstands abrasion well, but is slippery when wet, a disadvantage in floor and stair construction.

The fire-resistance of asbestos-wood is its chief recommendation. Being composed of incombustible materials, it cannot be burned, and exposure to fire merely causes gradual dehydration. Under prolonged red heat the boards are weakened, but their resistance is probably ample for such exposure as occurs in an average fire.

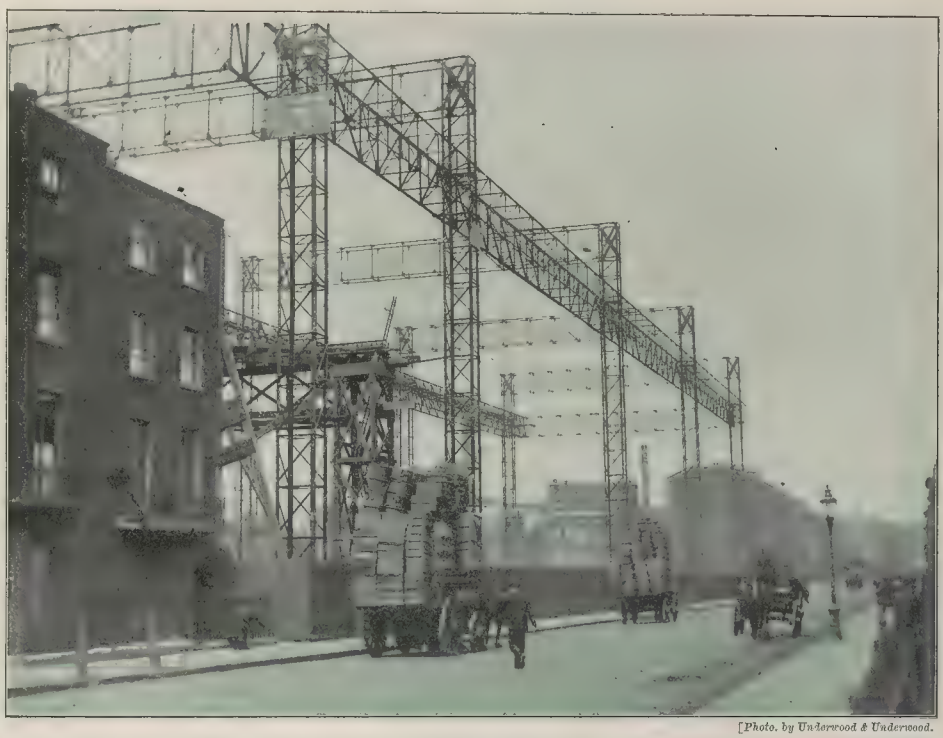
Professor Norton says that a ½-in. sheet of asbestos-wood may be placed over the top of an open furnace at 1,700 deg. Fahr., the flame impinging upon the lower surface of the sheet, and at the end of half an hour the sheet may be taken off and, while the under side is still white hot, plunged into cold water and then returned to the furnace for ten minutes, without injury beyond slight warping and a reduction of strength by 25 per cent. or more.

It is also stated that in some fire tests the paint on the outside of an asbestos-wood door, 1¼ in. thick, was not scorched after the fire on the other side had been burning at a temperature of 1,700 deg. Fahr. for more than an hour.

THE PASSING OF AN ANCIENT BRIDGE.

FOR nearly two centuries the River Severn has been spanned at Cressage by a wooden trestle bridge. The span is about 70 yds., and is supported by four trestles. Now this structure has been purchased for 1,000*l.* by the Shropshire County Council, and within a few weeks it is to be removed and its place taken by a stone bridge suited to the needs of modern traffic and free from toll. The stonework at either end is in good condition and will be incorporated in the new structure.

RAILLESS TRAMCARS.



THIS latest addition to vehicular traffic appears likely to become increasingly adopted, especially in the outlying districts of large towns. The description "railless tramcar" is somewhat of a misnomer, for the vehicle is really more of the omnibus class, and the chief fundamental difference between it and the motor-omnibus is that it is propelled by electrical power transmitted to it from an outside source instead of generating its own power while running, as is the case with the latter.

The vehicles, as regards chassis and body, are similar in appearance to the motor-'bus, but are fitted with trolley poles or flexible cables which convey the power from the overhead wires through the motors on the car in a manner resembling that employed with electric tramcars, with an additional overhead wire for the return current, in lieu of the metal rails. At first it may not be apparent what claims of superiority the "trolley 'bus"—by which name the vehicle is more aptly described—has over the tramcar or motor-'bus, but a closer investigation of the subject reveals several. There are many obvious and serious objections to electric tramway systems, the chief doubtless being the heavy initial expenditure in construction and subsequent costly maintenance of the permanent way. Again, probably everyone is cognisant of the nuisance of a tramway track in anything approaching a narrow thoroughfare, monopolising, as it does, practically the whole of the road, and when there is a frequent service of cars, rendering it quite impossible for tradesmen's carts or other conveyances to stand outside the shops or houses for many minutes at a time. The track also is a continual source of danger both to horsed vehicles and cyclists by reason of the grooved rails and the difficulty experienced in maintaining a level junction between the wood blocks or granite setts of the track with the margin on either side, generally formed in macadam. These objections, of course, do not exist with the "trolley omnibus."

The chief advantage claimed over the motor-'bus is that of economy, both in the generation and consumption of power. It is cheaper to generate power for a number of 'buses at a central station than for each 'bus to produce its own power as it runs. Then regarding the consumption of power, it is clear that the motor-omnibus must carry the maximum engine-power required at any particular portion of its journey; for instance, if there is but one hill on an otherwise practically level route, the power carried must be sufficient to negotiate that hill, so that for the remainder of the journey the 'bus is carrying extra and useless dead load in surplus plant and fuel, thus involving increased power consumption and adding to the wear of the tyres. On the contrary, the trolley 'bus helps itself to just sufficient power as required at that particular

Wooden Trestle Bridge at Cressage.

[*Photo. by Underwood & Underwood.*

Gantry in Stamford-street.

moment, so that at times it is actually using none at all.

It is hardly to be supposed that the trolley omnibus will supersede the electric tramcar in large cities and towns, for one, if no other reason, that the seating capacity is so much less. but there can be no doubt that it is eminently suitable for small towns where the demand for passenger transport barely warrants the expense of laying down a tram track, and also in the suburbs of the larger towns, to act as feeders to electric trams, by bringing passengers to the various termini, such as do the systems now running in the outlying districts of Leeds and Bradford. When there is legislation that will make it easier and less expensive to obtain Parliamentary powers for trolley omnibus working, this system of traction will most certainly develop rapidly.

GANTRY AT H.M. STATIONERY OFFICE BUILDING.

TO FACILITATE the construction of the reinforced concrete building now in course of erection in Stamford-street, S.E., for H.M. Stationery Office, the contractors, Messrs. Perry & Co. (Bow), Ltd., have adopted the novel idea of employing a large steel gantry as an alternative to the customary derrick towers or other provision for hoisting appliances.

The gantry is 250 ft. long by 90 ft. high by 75 ft. wide, and comprises nineteen steel stanchions supporting twenty-two girders, along the top of which are tracks for three electric travelling cranes to be used for hoisting steel, concrete, and other materials, which can be transported along the top of the gantry and deposited at points where required by the workmen engaged in building operations.

The structure was erected by Messrs. Isles, Ltd., of Stanningley, Leeds, having been designed so that it can be taken down readily and rebuilt on any other site in its present form, or adjusted to any length, width, or height according to the size of the building to be constructed or the space available.

Gantries of the kind have been used hitherto only in shipbuilding, but there is every reason for believing that their employment in the erection of important buildings should be both economical and convenient.

Messrs. Perry & Co. anticipate that the gantry at Stamford-street will save an enormous amount of labour, not only in hoisting and delivering supplies, but also in moving materials and appliances from place to place on the site.

NOVEL SUGGESTION FOR A BRIDGE ACROSS THE THAMES.

A CORRESPONDENT sends us the following suggestions, which will be of some interest to our readers:—

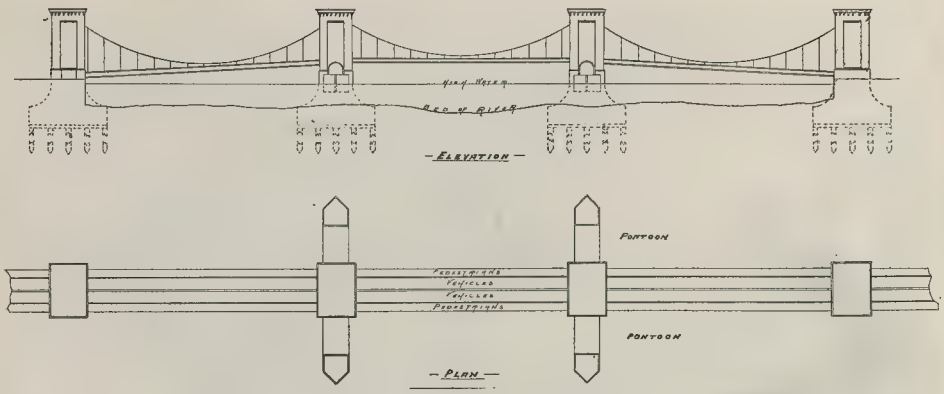
"If Lambeth Bridge were rebuilt according to a design which I am placing before the London County Council, there would be a level road right across the river at low water, and, as the bridge would rise with the tide, the two end portions would have easy gradients, the centre part, about one-third of the bridge, always remaining level. The design, illustrated on next page, shows it to be of the stiffened suspension type, of three spans, supported by two pontoons, and the ends resting on shore, leaving the waterway about the same as at present.

The forces to counteract the pull of the main chains of the centre span will be supplied by the pull of the main chains of the end spans acting automatically through hydraulic presses contained in the towers. Instead of the back chains of the side spans being anchored in the usual way, the pulls along them will be received by hydraulic rams also acting automatically to the towers.

A bridge, say, 48 ft. wide might be built first and another portion, say, 48 ft. wide could be added when increased traffic made it necessary, thus spreading the cost over a long period.

The towers shown are intended to be built of ferro-concrete faced with rubble granite, and to be in keeping with the masonry of the Embankment.

There would be four roads for vehicles and two for pedestrians, provision being made for protecting the latter from the weather and splashes, which will be appreciated by those who have to cross any of the existing storm-swept bridges.



The tides would elevate the bridge, pontoons, and the load, weighing some 5,000 tons, every twelve hours.

The cost would be about the same as a masonry bridge, but it could be built in a much shorter time. JOHN RAWLINGS."

ENGINEERING NOTES.

Value of Automatic Sprinklers. THE practical utility of automatic sprinkler installations was demonstrated recently in New York. An electrically-heated iron had been left on an ironing-board in a building in Madison-avenue, and as the user omitted to switch off the current an outbreak of fire occurred, with the result that at 7.27 p.m. an alarm call was automatically sent to the fire-station and the sprinklers at the same time came into operation. Three minutes later when firemen arrived on the scene the fire had already been extinguished by the sprinklers. In the absence of the safeguards adopted the fire would probably have assumed serious proportions before discovery.

Electrolysis in Pipes. IN consequence of stray currents from electric railways in Carlsruhe, gas and water pipes in that town have been corroded somewhat seriously. Careful investigation shows that destruction is confined to points where the currents pass from the pipes to the surrounding earth, while at the points of entry the action of the currents is protective. Consequently the remedy adopted is to place electrodes in the ground near the pipes at points where electrolytic action is to be feared, the electrodes being connected to the positive pole of a low voltage generator or storage battery and the pipes connected to the negative pole. This treatment appears to have given satisfactory results, and the current required is said to be a very small item.

A Novel Suggestion for Bridging the Thames. *(See previous page.)*

Considere System Standard Specification. LIKE other firms acting as specialists in reinforced concrete, the Considère Construction Company, Ltd., of Westminster, have now published a specification for the guidance of contractors executing works on their system. The provisions of the specification are generally similar to documents of the same class, and if carefully followed should have the effect of ensuring sound and reliable work. The pamphlet is clearly printed with marginal headings which will be found convenient for reference purposes.

Distinctive Colours for Pipes in Buildings. THE practice of colouring pipes to denote the nature of their contents has been adopted to some extent in this country for many years. The following system of colouring is one recently proposed in Germany, the colours being indicated by attaching to the pipes small strips of painted and enamelled iron :—

Contents of Pipe.	*Colour.*
Water.	Green.
Steam.	White.
Gas.	Yellow.
Air.	Blue.
Vacuum.	Grey.
Oil	Brown.
Acids.	Rose, with red streaks.
Lye.	Rose.
Tar.	Black.

The same colours are recommended for use in drawings, steam pipes to be shown by double lines.

Progress in Egypt. LORD KITCHENER, his Majesty's Agent and Consular-General, in his first report in that capacity, just presented to Parliament, states that the monumental work of the raised Aswan dam will be completed shortly, and the immense benefits accruing by the increased irrigation of the country will repay the expenditure many times over. Other completed improvements include the giving of *seifi* (summer) water to Upper Egypt and the abolition of the basin system, which for so long has restricted the full yield of the land. Now that abundant irrigation water is assured no effort should be spared to enable the inhabitants of Egypt to obtain the fullest advantage from their magnificent soil and climate, and the question of drainage, which has long been discussed, becomes one of vital importance. Measures are about to be taken to carry out a large and comprehensive scheme of drainage in the provinces of Behara and Gharbieh, and proposals for this purpose have been submitted to Sir William Garstin and Mr. Webb, whose technical knowledge and long experience of the country are unrivalled. The projects have been approved, and will be carried out without more delay than is necessary for such large works. Shortly stated, the result aimed at is the lowering of the water in the drains in those portions of the Delta to a depth of from 1½ to 2 metres below the surface of the soil. Elaborate experiments in the Domains show that if this result is achieved the yield per feddan in many parts will probably be doubled.

The most important works completed during 1911 were the Khanka Lunatic Asylum, the Minieh Post Office, the Agricultural School Farm, and some additions to Minieh Moudirieh, and police outposts at Matarieh and Diarb Negm. Work on the Boulak and Zamalek Bridges over the Nile has proceeded steadily throughout the year, and the bridges should be open to traffic before the end of 1912. In connexion with this scheme a supplementary credit was granted in the course of the year for the reconstruction of the "Pont des Anglais" over the Bahr-el-Aama. The new bridge, the contract for which was awarded to the Cleveland Bridge Company, of Darlington, will have an opening span to admit the passage of boat traffic. This is particularly necessary during the period of flood, when the navigation through the opening span of the new Boulak Bridge on the main branch of the river will be difficult. The work will be undertaken at once, and a temporary bridge erected so as to permit the passage of boats by the Bahr-el-Aama at the next flood.

In regard to the Antiquities Service, no archæological discovery of great importance was made during the year. In order to prevent illicit excavations and sales, which are frequently accompanied by the wanton destruction of antiquities, a law is being prepared to check such depredations. For some time past numerous sites alleged to contain archæological remains have been reserved for the department in different parts of the Delta. Steps are now being taken to ascertain by testing whether anything of interest actually exists under these areas.

Catskill Aqueduct. THIS aqueduct, now nearing completion, is designed to protect the city of New York from the dangers of water famine, which recur regularly with the droughts of the summer. The new tunnel by which the water is carried under the Hudson River at Storm King Mountain, has been formally opened after work extending over nearly seven years. The tunnel is bored in the solid rock at a depth of 1,100 ft. below the surface of the water, and connects with two vertical shafts, one on either side of the river, borings having proved that solid granite existed from shore to shore less than 1,000 ft. below the river surface. The total length is 3,030 ft., and the whole scheme is expected to be finished by 1913, and is designed to supply New York with 500,000,000 additional gallons daily.

New Process of Timber Seasoning. A METHOD employed in France for seasoning timber may be thus briefly described :—The timber is stacked upon a lead plate covering the bottom of a large tank, the plate being connected to the positive pole of a dynamo. On top of the timber another lead plate is placed and connected to the negative pole of the dynamo. The tank is filled with a solution containing 5 per cent. of resin, 10 per cent. of borax, and a trace of sodium carbonate. When electric current is passed through the stack of timber it is said that the sap is replaced by resin and borax. After the operation is completed the timber is removed and dried. It is claimed for this process that, however green the timber may have been before treatment, the result is always perfectly seasoned material.

The Toxicity of Paints. AN interesting communication concerning the toxicity of certain paints was recently made by Professor E. C. C. Baly to the Liverpool Section of the Society of Chemical Industry. It has been noticed that persons inhabiting rooms freshly painted with white lead paint often show symptoms of poisoning quite distinct from the symptoms of lead poisoning. The symptoms of lead poisoning are colic and constipation, whereas the ailments experienced by persons inhabiting freshly-painted rooms are commonly headache and diarrhœa. As the result of a number of experiments on the subject, Professor Baly has found that white lead and linseed oil emit a vapour, which he believes to be an aldehyde, which has toxic effects. The poisonous volatile substance does not contain any lead. It is emitted from a mixture of linseed oil and manganese dioxide, and also from linseed oil mixed with red lead, but it is not emitted in appreciable quantity from linseed oil mixed with either lead sulphate or zinc white. When turpentine was added to the mixture of white lead and linseed oil the poisonous vapour was emitted more readily than when no turpentine was present. Professor Baly is continuing his experiments and hopes to communicate some further results to the Society at an early date.

Crushing Strengths of Cements. MR. C. GOSLICH contributes to the *Chemiker Zeitung* of 1912 the results of tests made to ascertain the resistance to crushing of mixtures of Portland cement and of iron Portland cement with the blast-furnace slag, fine sand, and standard sand. These were made up in the proportions set forth in the subjoined table, and were tested after five years. To convert the resistances, expressed in kilogrammes per square centimetre, into pounds per square inch it is only necessary to multiply by 14·223, or approximately 14¼ :—

Mixtures Subject to Test.					Resistance to Crushing in kilogrammes per Square Centimetre.	
Cement.	Slag.	Fine Sand.	Standard Sand.	Portland Cement.	Iron Portland Cement.	
7	3	nil	20	642	}	551
7	nil	3	20	642	}	
7	3	nil	50	341	}	238
7	nil	3	50	249	}	
7	3	nil	70	157	}	117
7	nil	3	70	122	}	

It will be noticed that in the first pair of tests the effects of slag or of fine sand upon the Portland cement were identical, but with increases of standard sand, as in the second and third pairs of tests, the slag gave better results than the fine sand to the extent of 27 per cent. and 22 per cent. respectively.

THE BUILDING TRADE.

THE INSURANCE ACT.—III.

IN the former two articles we have dealt with the Insurance Act so far as it relates to unemployment insurance from the employer's point of view only, but we now propose to consider those provisions which concern the employee.

In our article of May 31 we pointed out that the two considerations which first arise are, to what trades does Part II. of the Act relate, and who is an employer or a workman within the Act, and on these two points it is unnecessary for us to recapitulate what we have said, for they affect employer and employed alike.

By sect. 84 every workman having been employed in an "insured trade" (see our former article, May 31 and Schedule VI.), who is unemployed, and in whose case the "statutory conditions" are fulfilled, shall, subject to the provisions of this part of the Act, be entitled to "unemployed benefit" so long as these conditions continue to be fulfilled and so long as he is not disqualified under the Act for the receipt of unemployed benefit. Having already indicated what are the "insured trades" and who are "workmen," the first thing now to be ascertained is what are the "statutory conditions." These are contained in sect. 86, and the workman has to prove (1) that he has been employed as a workman in an insured trade in each of not less than twenty-six separate calendar weeks in the preceding five years; (2) that he has made application for unemployed benefit in the prescribed manner, and proves he has since been continuously unemployed; (3) that he is capable of work, but unable to obtain suitable employment; (4) that he has not exhausted his right to unemployed benefit.

As regards (1), the expression "calendar week" is defined in the Act as "the period from midnight on one Sunday to midnight on the following Sunday." The expression is not very happy, as men employed in such trades cannot easily prove seven days' employment, but presumably six full working days must be intended. As regards (2), the method of application for unemployed benefit is prescribed by rules made under sect. 91 of the Act. Rule XI. of the Unemployment Insurance Regulations, 1912, provides that a workman shall attend at the local office at which his unemployment book is lodged on every working day between hours to be fixed by the Board of Trade and sign a register. If the workman lives at a distance of more than 3 miles from the local office the attendance is less frequent, but unless personal attendance is expressly excused a workman shall not be deemed to be unemployed on any day in respect of which he has not signed the register. When, however, the application has to be made to an association of workmen with whom an arrangement has been made under sect. 105, to which we shall refer later, the procedure is a little different. It will be observed that the workman has to prove continuous unemployment after his application. By sect. 107 this is defined as either "two periods of unemployment of not less than two days each, separated by a period of not more than two days, during which the workman has not been employed for more than twenty-four hours," or "two periods of unemployment of not less than one week each separated by an interval of not more than six weeks." Here it is to be noted the expression "calendar weeks" is not used, which enhances the difficulty of explaining its use above.

We now come to the third condition, proof of being capable to work, but unable to obtain suitable employment, and in connexion with this certain provisos to this section have to be considered.

It is provided that the workman shall not be deemed to have failed to fulfil the statutory conditions by reason only that he has declined (1) an offer of employment in a situation vacant in consequence of a stoppage of work due to a trade dispute; (2) an offer of employment in the district where he was last ordinarily employed at lower wages or on conditions less favourable than he has habitually obtained; (3) or an offer of work in any other district on conditions less favourable than those observed by associations of employers and workmen in such district or by "good employers."

We believe this is the first occasion on which the expression "good employers" appears in any Act of Parliament. The provisos in sect. 86 have to be read in connexion with sect. 87, for, although to fulfil the statutory conditions to obtain unemployed benefit a man need not accept a post rendered vacant in consequence of a trade dispute, by sect. 87 a man who has lost employment by reason of a stoppage of work due to a trade dispute is disqualified from receiving benefit, as also is a man who has lost his employment through misconduct or who has left his employment without just cause. In the former case the disqualification continues so long as the stoppage of work lasts; in the two latter instances the disqualification lasts six weeks.

It is also to be noted that by the same section sickness or disablement benefit received by the workman so long as it is paid to the workman is a disqualification for the simultaneous receipt of unemployment benefit.

Sect. 107 contains a definition of "trade dispute"—"any dispute between employers and workmen or between workmen and workmen which is connected with the employment or non-employment or the terms of employment, or with the conditions of labour of any persons, whether workmen in the employment of the employer with whom the dispute arises or not." This definition very nearly follows that in the Trade Disputes Act, 1906, and it recognises the "sympathetic strike."

With reference to the third statutory condition in sect. 86—*i.e.*, proof that the workman is capable of work—we may here refer to sect. 100, by which it is provided that if repeated failure on the part of an insured workman to obtain or retain employment appears to the insurance officer to be wholly or partly due to defects in knowledge and skill, he may test the workman's knowledge and skill. Failure to accept the test or failure to satisfy the test will be taken into consideration in determining what is suitable employment. If the workman is a hopeful subject, although defective in knowledge and skill, technical instruction may be given to him out of the unemployment fund.

It only remains to consider the fourth "statutory condition" under sect. 86, that the workman has not exhausted his "unemployment benefit." The rates and periods of unemployment benefit are contained in the seventh schedule, but it must be remembered that under sect. 84 no unemployment benefit is to be paid for any period of unemployment which occurs within six months of the commencement of the Act—*i.e.*, July 15, 1912.

The rate of unemployment benefit is in respect of each week following the first week of unemployment 7s., or such other rate as may be prescribed either generally or for any particular trade, but the rate cannot be increased above 8s. or reduced below 6s. This is for adults. When the workman is under seventeen he is paid no benefit, but while between seventeen and eighteen he receives half the rate which he would receive were he over eighteen, but no workman shall receive more unemployment benefit than in the proportion of one week's benefit for every five contributions paid by him or on his behalf, except when, as will be shown below, certain additional contributions are to be credited to him. Nothing can exceed the complication of this part of the Act, which should have been expressed in the clearest terms, but we will endeavour to explain it to some extent.

It will be seen that the duration of benefit depends upon the number of contributions. The eighth schedule lays down the contributions. "From every workman employed in an insured trade, 2½d. for every week he is so employed." This is qualified in two ways—(1) in respect of length of employment, (2) age of the workman. (1) If the employment is for less than a week it is to be treated as employment for a week, except it is less than two days. If it is less than two days, for one day the contribution is 1d., for more than one day 2d., but for the purpose of calculating contributions for unemployed benefit these reduced contributions are to be treated as two-fifths or four-fifths of a full contribution.

(2) Workmen below the age of eighteen contribute 1d. a full week (no provision is made in their case for shorter periods of employment), but this contribution is to be calculated as two-fifths of a full contribution in respect of unemployment benefit after he is eighteen. In the case of a workman over twenty-one Proviso (*a*) in the seventh schedule provides that "if he has habitually worked at an insured trade before the commencement of the Act, there shall be deemed to be added to the number of contributions he has actually paid five contributions for each period of three months or part of such period during which he has so worked before the commencement of the Act, up to a maximum of twenty-five contributions."

A period of unemployment commences after application has been made, but no workman shall receive benefit for more than fifteen weeks or such other number of weeks as may be prescribed within any period of twelve months, or in respect of any period less than a day.

Now let us endeavour to work out this complex series of puzzles set by the Legislature. Take the case of a man over twenty-one engaged in an insured trade (ten months before July 15, 1912) who becomes unemployed ten months after the commencement of the Act. We will say that during that period in which the Act has been in force he has paid forty-five contributions and been engaged by the week. In respect of those contributions, at the rate of five contributions for one week's benefit, he is entitled to nine weeks' benefit; but he is further entitled to five contributions for each period of three months or part of such period before the commencement of the Act—that is, during ten months, at five contributions to one week's benefit four additional weeks, or thirteen in all at 7s. per week or whatever rate may be prescribed.

The man of eighteen has paid in the same period also forty-five contributions, and if he was above eighteen when contributing he is entitled to nine weeks' benefit.

If he was below eighteen when contributing, but above eighteen when he became unemployed, his contributions for the purposes of benefit are treated as two-fifths of a contribution—*i.e.*, eighteen contributions, and at the rate of five contributions for a week's benefit he is entitled to three and three-fifths weeks' benefit. If he was below seventeen when contributing and when unemployed was still below eighteen, he receives benefit at half the rate he would if he were eighteen, but his contributions in this case are counted as full contributions. Below seventeen he receives no unemployment benefit at all.

It will be seen that an equally complicated series of mathematical problems have to be solved where a workman is employed for periods of less than a week, a contribution of 1d. for a day's work counting as but two-fifths of a contribution, two days four-fifths, and yet under sect. 86 the proof is put upon the workman that he has not exhausted his right to benefit. It is hardly possible to conceive a worse devised piece of legislation for the working classes—legislation which puzzles the trained lawyer.

By sect. 88 these questions are left to be determined by the "insurance officers," but when benefit is refused or stopped or not allowed in accordance with the claim the workman may require a report to be made to a court of referees. If the referees and the insurance officer disagree, the question may be referred to an umpire. As a matter of fact, we hardly imagine there will be many appeals, as the workman will be incapable of checking the decisions of the insurance officers.

There are other questions, such as refund arrangements with associations of workmen, etc., which we shall refer to in a further article.

BUILDERS AND FIRE INSURANCE.

AMONG the risks which the prudent builder takes into account before he enters on his work there is none more important than the risk of fire before completion. His entire profit may be swept away if a fire occurs against which he is not insured, for the bare undertaking to carry out works involves an agreement to complete in any event. The risk of fire attaches to the contractor, not to the employer.

Again, even if the fire is small in extent, to make good the damage must inevitably cause delay. Who is responsible for that delay?

Very definite provision is made for the risk of fire in the ordinary forms of contract. An example of a fire insurance clause in a contract for large works is supplied by the War Department conditions of contract, sect. 15 of which is in the following terms:—"The works, until delivered up to the Commanding Royal Engineer, shall stand at the risk of the contractor, who shall be responsible for and must make good all damage by fire, weather, or tempest, and for the delivery up of the buildings and works to the Commanding Royal Engineer in a clean state, and complete in every particular at the termination of this contract. All the glass in the sashes will be handed over to the contractor, and he must, after the completion of the work, give it over to the Royal Engineer Department in a perfect state, free from all cracks and breakages, and quite clean."

In Appleby *v.* Myers (1867), L. R. 2, C. P. 651, it was clearly stated that not even in the case of an entire contract for repairs or additions to a house belonging to the employer which is burnt previous to completion can the builder recover for work and materials done previous to completion, even although such materials may have by accession passed to the employer.

In that case Mr. Justice Blackburn said: "Generally, and in the absence of something to show a contrary intention, the bricklayer, or tailor, or shipwright is to be paid for the work and materials he has done and provided, although the whole work is not complete. . . . But, although this is the *prima facie* contract between those who enter into contracts for doing work and supplying materials, there is nothing to render it either illegal or absurd in the workman to agree to complete the whole, and to be paid when the whole is completed, and not till then. . . . Had the accidental fire left the defendant's premises untouched and only injured a part of the work which the plaintiff had already done, we apprehend that it is clear that the plaintiffs, under such a contract as the present, must have done that part over again in order to fulfil their contract to complete the whole and 'put it to work' [this was the case of machinery] for the sums above named respectively."

The liability of an insurance company is such that they may either elect to rebuild or reinstate the premises. In a Canadian case (Smith *v.* Colonial Insurance Company (1880), 6 Vict. L. R. 200) an insurance company elected to reinstate premises destroyed by fire instead of paying their value. A second fire occurred before reinstatement was complete. Held, that the insurers must reinstate a second time, even though this involved expenditure in excess of the amount insured.

The insurer who elects to reinstate puts himself in the position of a builder who undertakes to restore the destroyed buildings as nearly as possible to their former condition. If after the election to reinstate, reinstatement becomes illegal, the insurers will nevertheless be liable in damages for breach of the contract to reinstate.

It is obvious that when a building is destroyed a large part of the incombustible material may be so unaffected as to be capable of being used again. The rights of the builder are not altogether clear, for, strictly speaking, all the materials used on a building site become vested in the owner of the freehold.

Mr. Hudson, in his "Building Contracts" (page 345), expresses the following view on this point:—"Where a fire occurs in a new building in progress, which the builder is bound under his contract either impliedly or expressly to rebuild in the event of its destruction before completion, it would seem that, although the materials dislocated and detached from the freehold do not thereby revest in the builder, yet he is equitably entitled to utilise these materials so far as they are sound and good for the purpose of rebuilding, subject, of course, if the contract so requires, to their being approved by the architect. He is in much the same position as an insurer who has contracted to reinstate in case of fire, and who has a right to the salvage of the burnt building.

When the builder expressly contracts to insure the building in progress and the materials on the site, which is frequently the case, he then becomes an insurer and entitled to all the rights and subject to all the liabilities of an insurer."

In a New Zealand case the plaintiff contracted to build on additions to the defendants' stores. The plaintiff was to make good any damage caused by fire. Materials brought on to the ground were to become the defendant's property. An accidental fire destroyed the store, the uncompleted additions, and the materials on the ground. It was held that the plaintiff could not recover for work and labour done, inasmuch as a certificate from the architect was a condition precedent to his right to payment; nor for the materials as they had become the defendant's property, and this part of the contract was not severable from the rest. It was held also that the defendant was in law excused from performance of the contract on his part.

The rights of a sub-contractor who has put good work into a partially-destroyed building are not any easier to define than are those of the builder. It is presumed, however, that if he has done and completed his part of the work he is entitled to be paid. In an American case it was held that where a sub-contractor has performed substantially all he contracted for, and before the entire work is performed by the principal contractor the building is destroyed by fire, and the owner and the original owner make a settlement in which deduction is made of the value of whatever remained unperformed on the sub-contract, the sub-contractor is entitled to recover for the work actually done by him, notwithstanding that the sub-contract is not completely performed.

CONCRETE-MIXERS:

THE ROLL MIXER.

THE type of concrete-mixing machine to which attention will now be devoted consists essentially of a rotatory drum, so shaped inside that scoops are not required for mixing purposes.

It is claimed by the makers that the relatively small power taken and the light running of the machine conduce to small maintenance charges and long life, in addition to economical working.

The mixing drum consists of two hollow castings, one keyed to the driving shaft and the other attached to the shaft in such manner that it can be moved laterally by a simple hand-lever in the small sizes and by means of a worm gear in the larger sizes. This arrangement is for the purpose of providing for the instantaneous discharge of the concrete.

Fig. 1 is a section through the drum when closed for mixing concrete. By the slow rotation of the drum the position of the material is constantly changed, and as the inside walls are sharply inclined a cross fall is brought about by which the material is thoroughly mixed in all directions, as suggested by the section. Fig. 2 shows the drum with the right-hand casting moved to open a gap for discharge of the mixed concrete.

The machine is fitted in several styles to suit requirement, but the general arrangement of the drum and auxiliaries is sufficiently indicated by the illustration reproduced in Fig. 3. All types and sizes can be fitted with a special material hoist operated by the pulley driving the mixer, and which enables each batch of concrete to be hoisted to any required height.

Materials to be mixed are placed in a feed hopper, which is raised by lifting gear and

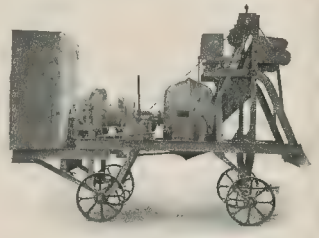


Fig. 3. The Roll Concrete-Mixer.

emptied into the drum. As this revolves, its contents are completely mixed in from thirty to sixty seconds, at first dry and then with water. While the mixing operation is being conducted, the feed hopper is lowered and refilled in readiness for the next batch of concrete.

The drum is emptied by moving the lever acting upon the worm gear, and by reversing the lever the drum is again closed and ready to be refilled.

Water is admitted from a tank, arranged so that the quantity admitted can be adjusted at will.

The Roll mixer is supplied by Builders' and Contractors' Plant, Ltd., of 17, Victoria-street, Westminster.

FEES FOR SPECIFICATION.

BUILDERS and others who are in the habit of competing for contracts advertised by public tender are always anxious to obtain as much information as possible before committing themselves to a figure. The statement in the advertisement is, of course, wholly insufficient, but the advertisement frequently alludes to the fact that further information is available if a small fee is paid.

Public and other bodies, however, who invite tenders have a habit of making a charge for copies of the specifications. In some cases the payment of one guinea, which is not returnable, is demanded for plans and specifications. In other cases the tenderer is supplied with one copy of the specification, which has to be returned, and if he requires other copies he must either make them out himself or pay for them.

It is pointed out that this is a matter of considerable hardship to contractors; and it is obvious that the payment of even so small a sum as one guinea before the would-be tenderer knows anything about the work which he will have to do may be just enough to put smaller firms out of the running.

There does not appear to be any legal remedy.

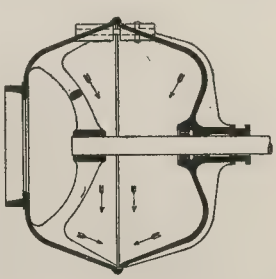

Fig. 1. Drum Closed.

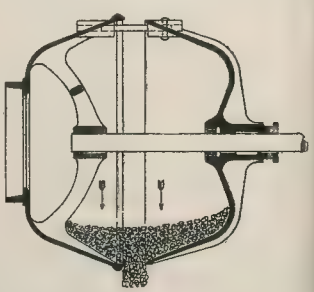

Fig. 2. Drum Opened.

The Roll Concrete-Mixer.

To write for specifications in the circumstances mentioned is to consent to the payment of one guinea in any event. Furthermore, by the Public Health Act, 1875, before any contract of the value or amount of 100*l.* or upwards is entered into by an urban authority, at least ten days' public notice must be given, stating the nature and purpose of the proposed contract and inviting tenders for the execution of the works; and the urban authorities must also take sufficient security for the due performance of the contract. They are thus bound by statute to invite tenders; and it is obvious that if they were to send out a copy of the specification gratis to every applicant considerable expense might be unnecessarily incurred. It might be possible, however, for the party inviting tenders to publish an abridged form of specification which could be obtained at a purely nominal cost, and which would enable a would-be tenderer to decide off-hand whether execution of the proposed works would be at all feasible.

There are circumstances, however, in which the cost of a specification paid for in circumstances similar to those above mentioned may be recovered. In a case heard last year the corporation of a town invited tenders. The sum of one guinea was payable for a copy of the specification, and the sum of 100*l.* was payable as a deposit with each tender. A firm who sent in a tender received a notification to the effect that their tender was accepted, and they then attended to view the plans and to peruse the conditions of contract. Instead of reading the conditions they asked the engineer of the corporation whether the conditions were in the usual form. He replied that they were. Subsequently on reading the conditions it was found that they were of the most unusual description, and the tenderers refused to sign a contract. They then brought an action to recover the deposit and the sum of 1*l.* 1s. which had been paid for the specification. Mr. Justice Channell held that they were entitled to recover both sums. This, of course, was an unusual case which is not likely to recur. Had the tenderers merely declined to go on with the contract because they found they had under-estimated the cost neither sum could have been recovered.

LAND VALUATION.

THE President of the Land Union announces in the *Times* a further case of valuation in which the Referee has revised the original value placed upon a small property. The figures quoted are a little difficult to follow, but the main point seems to have been that, whereas the valuer only allowed the exact cost of making up a road in front of the house as an owner's expenditure to be taken into consideration in arriving at the taxable value for increment value duty, the Referee decided that land given up for streets should also be considered.

GOVERNMENT CONTRACTS.

THE following tenders have been accepted during the past month by the Government Departments named:—*Admiralty, Works Department:* Portland cement—the Associated British Portland Cement Manufacturers, Ltd., Aldermans House, Bishopsgate, E.C.: British Portland Cement Manufacturers, Ltd., Aldermans House, Bishopsgate, E.C.: Messrs. Trechmann, Weekes, & Co., Ltd., 6, Lloyd's-avenue, Fenchurch-street, E.C; the Artillery and Albion Cement Company, Ltd., Greenhithe, Kent; the Wouldham Cement Company, 35, Gt. St. Helens, E.C.; reconstruction of bridge at Four Elms-hill, Chattenden—Messrs. Goddard, Massey, & Warner, Ltd., Traffic street, Nottingham. *Admiralty, Contract Department:* Carpenters' and joiners' work—Messrs. G. G. Bussey & Co., Ltd., Peckham, S.E.; Messrs. East & Son, Berkhamsted, Herts; the India-Rubber, Gutta-Percha, and Telegraph Works Company, Ltd., Silvertown, E.; Messrs. F. Merrick & Son, Glaston bury, Somerset; Mr. G. W. Shaw, 222, High-street, Poplar, E.; Mr. S. Snawdon, Yealmpton, Plymouth; Messrs. E Spencer & Co., Longfellow-road, Bow, E.; the South-Western Building and Steam Joinery Company, Ltd., Lees lane, Gosport; Messrs. Watt, Torrance, & Co., Muirhouse Sawmills, Glasgow; fireclay Messrs. G. K. Harrison, Ltd., Stourbridge; Mr. J. Walker, Kingswinford, Dudley. *War Office:* Washing basins—Messrs. S. E. & J. Fellows, Ltd., Wolverhampton; works services: alterations, etc., at Kilkenny Barracks—Mr. M. Dunne, King-street, Kilkenny; alterations, etc., at married quarters, Depôt, Barracks, Bury—Messrs. J. Fowles & Sons, 13, Hornby-street, Heywood; alterations, etc., at married quarters, Fulwood Barracks, Preston—Messrs. R. Thompson & Morris, 13, Dalton-square, Lancaster; erection of annexes to married soldiers' quarters, Carlisle—Messrs. J. & R. Bell, Nelson street, Carlisle; erection of officers' houses, Tidworth—Messrs. S. Roberts, Ltd., 81, Old Town-street, Plymouth; erection of offices, Army Aircraft Factory, South Farnborough—Messrs. Martin, Wells, & Co., Ltd., Aldershot; erection of quarters, Fort Bovisand, Plymouth — Messrs. Wakeham Brothers, Friary yard, Knighton-road, Plymouth; foundations and site work for dirigible shed, North Aldershot—the General Building Company, 45, Chandos-street, W.C.; installation of electric light, Central Flying School, Salisbury Plain—Messrs. Foote & Milne, Ltd., 66, Victoria-street, S.W.; repair and maintenance of War Department buildings at:—Blackdown and Deepcut—Mr. E. C. Hughes, Albion Works, Wokingham; Guildford, Mill Hill, and Woolwich—Messrs. J. Dorey & Co., Ltd., Brentford; Woolwich (ordnance factories)—Messrs. W. F. Blay, Ltd., Dartford; repair of roads at Royal Gunpowder Factory, Waltham Abbey—Messrs. Bristowe & Co., Ltd., 20, Tothill-street, Westminster; repairs to stable paving, Cavalry Barracks, Colchester—Mr. W. Chambers, 101, Magdalen street, Colchester. *India Office, Store Department:* Fireclay—Messrs. Timmis & Co., Stourbridge. *Crown Agents for the Colonies:* Cement—the Associated Portland Cement Manufacturers, Ltd., 8, Lloyd's-avenue, E.C.; Peter's Branch of the British Portland Cement Manufacturers, Ltd., 72, Victoria-street, S.W.; goods shed—Messrs. A. Findlay & Co., Ltd., 9, Victoria-street, S.W.; countess slates—the Oakly Slate Quarries, Ltd., Portmadoc. *Office of Works:* Builders' work: alterations, Abingdon Post Office—Messrs. T. H. Kingerlee & Sons, Oxford; enlargement, Darlington Post Office, and adaption Sunderland Labour Exchange—Mr. W. B. Cooper, 5, Park-place, East Sunderland; redrainage, Mount Pleasant Parcel Office, third contract — Messrs. Galbraith Brothers, Ltd., Camberwell-green Works, S.E.: heating apparatus, Birmingham Telegraph Stores—Messrs. H. J. Cash & Co., Ltd., Caxton House, Westminster, S.W.: ornamental metalwork, British Museum—the Bromsgrove Guild, Bromsgrove; wood-block flooring, Royal Courts of Justice extension—Messrs. Ellis, Geary, & Co., 5, Cannon-street, E.C. *General Post Office:* Laying a line of Sykes ducts and hollow cement conduits in Hampstead, N.W. Messrs. J. Mowlem & Co., Ltd., Grosvenor Wharf, Westminster, S.W.: laying lines of pipes in Brighton—Mr. J. A. Ewart, 21, Old Queen-street, Westminster, S.W.; laying a line of Sykes ducts in Mile End-road and Bow-road, E.—Messrs. Grounds & Newton, Page-green, South Tottenham, N. *Commissioners of Public Works, Ireland:* Building works: erecting and furnishing Gazebo National School, Co Kilkenny—Mr. J. Mulhall, Castlecomer, Co. Kilkenny; erecting and furnishing Knock National School, Co. Mayo—Mr. P. J. Gilmartin, Ballina, Co. Mayo.

BURMESE TEAK.

IN the report just published by the India Office on the progress and condition of India it is stated that the reserved forest area in Burma has been increased to 26,077 sq. miles. The unclassed forests, much of which will ultimately be brought under cultivation, cover 111,150 sq. miles. The majority of the teak-bearing forests are now being managed under working plans of the girdling schemes, though lack of labour or establishment make it impossible to carry out all the improvements projected in the sanctioned plans. The number of teak trees girdled was 112,500, and the quantity of teak extracted was 309,800 cubic tons (including 262,100 by purchase contractors), an increase of 25,200 tons. The price of teak ruled high. Of other timbers, 327,100 cubic tons were extracted. The area under teak worked by the department is being strictly curtailed in favour of the system of extraction by firms under purchase contracts.

THE BUILDING TRADE UNIONS.

It is stated that a private Conference of trade unions representing men employed in the building trade was held in London on the 24th inst., to consider the proposed amalgamation of the unions under the title of the Amalgamated Building Workers' Union, with a view to maintaining "a fighting organisation working to improve the conditions of the workers." At the end of the meeting Mr. Bowerman, M.P., stated that the Conference, which represented thirteen unions, had approved the scheme. A ballot of the members concerned will be taken not later than September 30.

NATIONAL INSURANCE ACT.

IN the House of Commons a few days ago, Sir Frederick Cawley asked the President of the Board of Trade whether joiners and millwrights employed permanently in factories to keep the buildings and machinery in repair are included in Part II. of the National Insurance Act.

Mr. Robertson replied that, by sect. 91 of the Act, decisions as to whether any workman, or class of workman, come within the scope of the scheme of unemployment insurance, rests not with the Board of Trade but with the Umpire appointed under sect. 89. He might mention that the Umpire has decided that contributions are payable in respect of joiners engaged wholly or mainly in the work of construction, alteration, repair, decoration, or demolition of buildings, and in respect of smiths and mechanics who are engaged wholly or mainly in the work of maintenance or upkeep of machinery, although the work is connected with businesses other than those included under the trades specified in the Sixth Schedule of the Act.

GENERAL BUILDING NEWS.

CHURCH AND SCHOOL, NORTH ORMESBY.

Mr. T. W. T. Richardson, M.S.A., is the architect for the new Primitive Methodist church and school in Ormesby-road, which has been erected at a cost of 2,493*l.* The church is 50 ft. long and 31 ft. wide, and will seat 430 people, while the school has accommodation for 400. The builders are Messrs. Duchars & Bowers, of Middlesbrough.

PARISH CHURCH, WHITERINCH.

This church is being erected from the plans prepared by Mr. Macgregor Chalmers, architect, and the cost of the work will be about 5,200*l.* The building will seat 900 persons.

CHURCH HALL, DUDLEY.

Messrs. Hicks & Charlewood, of Newcastle, are the architects for the St. Paul's Church hall, which has been erected at a cost of 450*l.* The hall seats 200 people, and the contract was carried out by Mr. Thomas Atkinson, builder, of Newcastle.

NATIONAL GALLERY, SCOTLAND.

The enlarged buildings of the Scottish National Gallery were opened recently by the Secretary for Scotland. The alterations to the gallery have been carried out under the supervision of Mr. Oldrieve, of H.M. Office of Works.

MECHANICS' INSTITUTE, NEWSHAM.

Mr. J. Goulding, of Blyth, is the architect for this new institute which is being erected at a cost of about 1,000*l.* The new work includes a large public hall and a caretaker's house. The contract was carried out by Messrs. A. Best & Co, of Newsham.

ENLARGEMENT OF LINSLADE, BUCKS.

The Vicar and Churchwardens of St. Barnabas Church have instructed Mr. J. T. Lawrence, Lic.R.I.B.A., of London, to prepare designs for the enlargement, reseating, and heating of the church.

TRADE NEWS.

Under the direction of Mr. J. A. Macgregor, architect, Castle-Douglas, Scotland, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air-inlets, has been applied to Corsock Church, Corsock, Scotland.

The new Isolation Hospital, Earlestown, is being supplied with Shorland's double-fronted patent Manchester stoves and patent Manchester grates by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

AT the last meeting of the London County Council the following applications under the London Building Acts were dealt with. (The names of the applicants are given in parentheses):—

Lines of Frontage and Projections.

Wolstanton School. Mr. E. Hollingshead, Urban District Council Offices, Wolstanton

Worcester.—School (750 places); Mr. T. Duckworth, Town Hall, Worcester.

A HERTFORDSHIRE FIRM'S RECORD.

At a coming-of-age celebration at Hitchin, Herts, on Saturday, of the oldest son of Mr. Francis Newton, builder and decorator, it was stated that the firm had continued in the same family from 1728 to the present day, a period of over 180 years. This record is unique in Hertfordshire, and will probably bear comparison for continuity of family business control with any similar trade in the country. The eldest son of the present proprietor, Mr. Francis Newton, is the sixth generation to enter the business. After a presentation had been made to him from the employees, Mr. Francis Newton, in responding to the toast of the firm, stated that two families of workmen were now employed to the third generation with the firm. In these days of hurry, scurry, and industrial unrest, it is reassuring to note that the old foundations of business prosperity, that of harmony between employer and employed, are not altogether obsolete.

WESTMINSTER CITY COUNCIL.

At the fortnightly sitting of this Council on June 20 the following, amongst other matters, were dealt with:—

Underground Convenience.—It was agreed to construct an underground convenience for women in Vauxhall Bridge-road, at an estimated cost of 1,600*l.*

Savoy Hotel.—Consent was given to the extension of the vaults of the Savoy Hotel under Somerset-street, subject to certain conditions.

Building Line of Wardour-street.—The City Engineer reported that, at the request of Messrs. Blow & Billerey, the architects to the owner, he has set out the building line at Nos. 103 to 109, Wardour-street, with a clear width of 40 ft. between the face of the granite piers of the new building on the east side of Nos. 76 to 78, Wardour-street, on the opposite side of the street, and the base of the proposed plinths of the new building to be erected at Nos. 103 to 109, Wardour-street. A representative of the London County Council attended and confirmed the building line as set out.

Combined Strip Pavement.—It was reported that a representative of the Royal Society for the Prevention of Cruelty to Animals had expressed the opinion that the combined strip pavement which has been laid in the carriageway of Piccadilly-circus is the best piece of paving in London.

Setting Back of Abingdon-street.—A communication had been received from H.M. Office of Works suggesting a delay in the setting back of Nos. 29 and 32, Abingdon-street, to see whether, when the rest of the improvement is carried out, such setting back will be really necessary. It was decided to make representations that the Council would like to see the whole improvement carried out at the earliest possible moment.

FOREIGN AND COLONIAL.

Activity of the Building Trade in Hungary.

An enormous development in the building trade has (Mr. Consul Grant Duff reports) been the most salient commercial feature of the past year in Hungary. In Budapest alone 600 new houses were finished, many of them very large ones. Extensive building also took place in Debreczen, Temesvár, and other important towns. The Budapest kilns furnished over 300,000,000 bricks during the year, and still have large orders in hand. The cement factories have also been very active owing to the large employment of concrete in building. Six hundred kiloms. of road have been undertaken by various municipalities, making a total of 11,400 kiloms. of State roads. The largest bridges built during the year were those over the Theiss at Záhany, over the Vag at Szered, and the Danube-Vag at Komárom. It is proposed to repair and enlarge the famous Kettenbrücke at Budapest, and to construct another Danube bridge in the capital.

Building Material and Requisites, San Salvador.

H.M. Consul at San Salvador (Mr. W. E. Coldwell) has forwarded a copy and translation of a decree, dated May 13, authorising the Board of Works of that city to make contracts for the erection of six buildings of reinforced concrete (or similar material) as follows:—(1) Palace of Justice; (2) General Post Office; (3) School for Arts and Crafts; (4) House of Correction for Juvenile Offenders; and (5 and 6) Normal School of Masters and Mistresses.

Building Material, Brazil.

The *Diario Official* of May 18 publishes decrees, as follows:—(1) Granting in favour of the Ministry of Justice and Home Affairs an extraordinary credit of 500,000 milreis (about 33,300*l.*) for the purpose of completing the erection of the cavalry baracks required for the Police Brigade in Rio de Janeiro. (2) Granting in favour of the Ministry of Communications and Public Works a credit of 600,000 milreis (about 40,000*l.*) for the construction of a Postal Telegraph Office in Nictheroy, State of Rio de Janeiro.

Building Material, Argentina.

The *Boletin Oficial* (Buenos Aires) of May 18 publishes a decree authorising the Superintendent of Military Construction to award to Señor Luis Loreti a contract for the construction of infantry barracks at San Nicolás (Province of Buenos Aires) for the sum of 320,705 pesos (about 28,000*l.*).

LEGAL COLUMN.

Boundaries to Highways.

In the case of Attorney-General and Uckfield Rural District Council *v.* Lindsay-Hogg, reported in the *Weekly Notes*, a short point of interest was decided. The plaintiffs claimed a declaration that certain portions of roadside waste formed part of a public highway. The land in question lay between two hedges, one of which had never been planted, but had sprung up naturally, and in these circumstances the Court held that the presumption did not arise that every part of the land between the hedges had been dedicated to the public. In the result the action was dismissed.

LAW REPORTS.

COURT OF APPEAL.
(Before Lords Justices FLETCHER MOULTON and BUCKLEY, and Mr. Justice PARKER.)

Padbury *v.* Holliday & Greenwood and Others.

THIS case, which involved an important question as to the liability of contractors who employed a sub-contractor, for personal injuries inflicted upon a stranger through the negligence of a servant of the sub-contractor, was heard last week upon the application of the defendants, Messrs. Holliday & Greenwood, Ltd., for judgment or new trial in the action which was tried before Mr. Justice Coleridge and a special jury on February 16 last (reported in the issue of the *Builder* of February 23).

The action was brought by Mr. A. G. Padbury, a traveller for a firm of horse-shoe manufacturers at Birmingham, against Messrs. Holliday & Greenwood, Ltd., builders and contractors, of Loughborough Park, Brixton, and Messrs. Wainwright & Waring, Ltd., of Chiswick, to recover damages for personal injuries sustained by him in the following circumstances:—

Messrs. Holliday & Greenwood had been employed by the City of London Real Property Company, Ltd., the building owners, to erect premises in Fenchurch-street, and the contract involved the employment by Messrs. Holliday & Greenwood of sub contractors to execute special works, and the work of putting metallic casements into the windows was entrusted to Messrs. Wainwright & Waring, Ltd. On January 4, 1911, while one of the casements was being put in, an iron tool was placed by a workman in the employment of Messrs. Wainwright & Waring on a window-sill, and the casement, having apparently been blown to by the wind, the tool fell and struck the plaintiff, who was passing along Fenchurch-street at the time, and caused him serious injury.

The defendants, Messrs. Holliday & Greenwood, denied negligence, and in the alternative said that if there was negligence it was not their negligence, but that of their sub-contractors, Messrs. Wainwright & Waring, Ltd., in failing to provide suitable protection to the public. Messrs. Wainwright & Waring did not enter an appearance to the writ, but subsequently the plaintiff discontinued the action against them.

At the trial the jury found, in answer to specific questions left to them by the learned Judge, that the falling of the tool was something which might reasonably have been foreseen by the defendants, having regard to the character of the work being executed by the sub-contractors; that the defendants ought reasonably to have foreseen such a possibility; that the defendants did not take precautions to avoid such a possibility; and they assessed the damages at 500*l.*, and upon the findings the learned Judge gave judgment for the plaintiff as against Messrs. Holliday & Greenwood for 500*l.* and costs. From this decision Messrs. Holliday & Greenwood now appealed.

Mr. Spencer Bower, K.C., and Mr. Stuart Bevan, appeared for the appellants; and Mr. Hohler, K.C., and Mr. Shakspeare for the respondent.

At the conclusion of the arguments of Counsel, Lord Justice Moulton, in delivering judgment, after stating the facts, said he was of opinion, having regard to the decision of the House of Lords in the case of "Dalton *v.* Angus," that before a superior employer could be held liable for the negligent act of a servant of a sub-contractor it must be shown that the work which the sub-contractor was employed to do was work the nature of which, and not merely the performance of which, cast upon the superior employer the duty of taking precautions. In the present case the tool was not placed on the window-sill in the normal course of doing the work which the sub-contractors were employed to do. The fact that the work which was being done was work to the window seemed to him to be immaterial. He thought that the case would have been the same if the work had been purely internal work. He could see no reason for saying that the operation of putting the casement into the window caused the tool to be placed on the window-sill or to fall off. The act which caused the injury to the plaintiff was an act of collateral negligence by a workman who was a servant of Messrs. Wainwright & Waring, and not a servant of the appellants, and therefore the latter were not liable for the consequences of that negligence. He was of opinion, therefore, that the appeal should be allowed, and judgment entered for the appellants with costs.

Lord Justice Buckley and Mr. Justice Parker also delivered judgments allowing the appeal.

KING'S BENCH DIVISIONAL COURT.
(Before Justices BRAY and BANKES.)

Contractor's Successful Appeal: Wilkinson *v.* Shorrock.

THIS case came on for hearing on June 21 upon the defendant's appeal from a judgment of Judge Hamilton at the Haslingden and Accrington County Court.

Mr. Scott appeared for the appellant, and Mr. Hume Williams, K.C., for the respondent.

Mr. Scott, in opening the appeal, said that the action in the County Court was against the defendant—who was a contractor in a large way of business—by an infant in respect to damages for personal injuries caused by alleged negligence, and the result was a verdict for the plaintiff and an award of 30*l.* damages. The appeal before their Lordships was on the ground that there was no evidence of negligence on defendant's part at all. The facts were that defendant was engaged near Accrington in the erection of a mill, and for the purposes of his operations he had made an opening in a fence or wall, and in it had placed an ordinary "contractor's gate." The opening was for the purpose of admitting materials to the building site. There was a distance of about 3 ft. between the gate entrance and the public road—a small by-street, which contained a number of cottages where the child plaintiff, a girl named Doris Wilkinson lived. One Saturday afternoon the girl was found lying beneath the gate injured under the following circumstances:—Mr. Shorrock and his men had left the work at noon, the gate having been properly fixed up; but the servants of a sub-contractor had remained on the premises. Apparently what happened was that, totally unexpected, during the Saturday afternoon, a certain brick company, who were contractors for the supply of bricks, brought a load for the site. The carman found the gate fixed in position, and got the aid of some other man to lift it from the "slots" so that the load might come through. The carter found the gate in this closed condition at 2.30, and so it was apparently on removal propped up against the wall, and soon afterwards it was found that it had fallen on the child. It was obvious that the brick company's carter was not the servant of the defendant, nor were the men employed by the sub-contractor the defendant's servants, and yet on these undisputed facts the Judge had held that the defendant was nevertheless liable for the injury to the child. He submitted that the Court should allow the appeal as there was no evidence as to how the accident happened at all, and it was impossible to bring home negligence to the defendant.

Counsel said that Judge Hamilton, in his judgment, had found that the defendant was responsible for the safety of the gate and responsible to secure it if all the workmen had left, and that he was guilty of negligence in permitting his sub contractor's men to continue to work on the premises after his own foreman had closed the gate and left the works. The Judge also took the view that the defendant knew that the sub-contractor's men might be coming to work on the site, and it was the defendant's duty to see that his usual man or some other man was left to look after the gate, and finally put it safely in position after the other workmen had left the premises.

Mr. Scott proceeded to argue that the Judge was wrong, as the gate was not a dangerous thing *per se*. One might just as well say that a flag-stone was a dangerous thing or a baulk of timber. The judgment (he submitted) was given under an entire misapprehension, and Counsel added that the defendant complained of the bricks being delivered on the Saturday afternoon, but had said that if he had been there, as a matter of courtesy, he would not have refused them. There was no evidence as to the accident—it might have been occasioned by boys "skylarking" and helping the child into the danger. Somebody might have given the gate a shove. It could not possibly be said that a gate like this was "a nuisance"; when it was removed and properly put against the wall there was no danger associated with it at all. The finding of the child in the position in which she was discovered was consistent absolutely with no breach of duty by anybody. The plaintiff must fail because she had not discharged the burden of proof that the defendant had some special duty on the ground that the gate was *per se* dangerous.

For the respondent, Mr. Hume Williams, K.C., submitted that here the case depended on two or three simple questions of fact. The gate was an ordinary contractor's gate placed there by the defendant for his own purposes, and it was one that had to be moved before access could be got to the site. The defendant had a man in his employment whose duty it was to be at the gate and help take it off and on so long as it was being used. Another fact was that the gate was taken off, and it was the defendant's servant's duty to see that it was placed in such a position in the road that it was not a nuisance and a public danger. In his evidence the defendant's gateman had deposed, "we used to lift the gate off first thing in the morning, and we put it into such a position during the day that no man could knock it over." Another important fact was that the defendant knew that on this Saturday afternoon the gate might be used, and that it must be taken off. If a sub-contractor was left at work on a Saturday afternoon it was reasonable that the defendant should know that goods might be required to be taken into the premises. So long as defendant knew that the gate might have to come off he knew that it was liable to become a nuisance, and it was his duty to see that somebody was there to guard it from being a nuisance "as against the whole world," and it was because he did not do that that the accident happened. Had defendant's gateman been there there would have been no accident. If one created a nuisance one must take the consequences.

Mr. Justice Bray, in delivering judgment, said that, in his opinion, there was no evidence of negligence against the defendant to submit to a jury had there been a jury trying the case. Judge Hamilton had said that he found the defendant to be responsible for the safety of the gate after all the workmen had left the premises on the Saturday, but he did not say on what grounds he came to such a conclusion. There was, in fact, no evidence to warrant that particular conclusion. The County Court Judge had held that defendant was negligent in permitting his sub-contractors to continue to work on the premises after his own foreman had finally fixed the gate and left the works; but he (Mr. Justice Bray) did not agree with that at all. If such constituted negligence, it was, at any rate, not the cause of the accident, because the evidence showed that the sub-contractor's men, in fact, had nothing to do with it. The accident happened through the brick-carter coming when he was not reasonably expected. There was no evidence whatever to justify the Judge's conclusions, and the appeal must be allowed with costs, and judgment entered for the defendant.

Mr. Justice Bankes concurred.

Builder's Action against the Finchley Urban District Council.

MR. JUSTICE JOYCE, on June 20, delivered a considered judgment in the case of Denman *v.* the Finchley Urban District Council.

The litigation arose out of the right of plaintiff to connect water-gullies, etc., with the Council's sewer in Clarence gardens, Dollis Park, and raised an important question to builders and frontagers in the district. Mr. Denman is a builder, and last month sought an injunction to restrain the Council from interfering with his work of joining up pipes with the sewer in Clarence-gardens. It was then stated that notice had been served upon him under sect. 150 of the Public Health Act, 1875, requiring him to make up the road. Mr. Denman, being one of the several frontagers, made an arrangement with the other frontagers that he should carry out the work on behalf of all of them. The notice of the Council gave him only six weeks in which to do the work, and when that time had elapsed the work was not completed, the time being quite insufficient.

Defendants took up the position that as the work was not completed within the time they were entitled to treat the matter as if no notice whatever had, in fact, been given to plaintiff, and as if his authority to do the work had lapsed. They claimed they were entitled to do the work themselves and charge

the frontagers with the cost of it, but finally refused to do it themselves or allow plaintiff to finish the job under their legal rights. The road in question was partly made up when plaintiff made excavations for the purpose of connecting his surface drains with the sewers. The connexion was, in fact, practically made, and, plaintiff contended, if the Council succeeded in sustaining the position they took up in the matter, the whole of his work done would be destroyed. Plaintiff pleaded that either he or the defendant Council should be allowed to make the connexions.

The result of the controversy was that the Council ultimately agreed to connect up the plaintiff's pipes without prejudice to their legal rights. So that the issue remaining was, who should pay the costs? To decide the question the matter had to be fully gone into before the learned Judge.

His Lordship, reading his considered judgment, said he was surprised to find that the point involved had never before been decided. Sect. 150 of the Public Health Act, 1875, under which these proceedings came, said nothing about a time limit. All it said was that if the statutory notice was not complied with, then the local authority could step in, do the work themselves, and charge the frontagers with the cost.

The Council contended that if the work of connecting up was not done within the stipulated time, then they were entitled to step in, even while the frontager was doing the work, and prevent any connexion being made with their sewer, leaving the frontager to any remedy he might have—he (the Judge) supposed leaving the frontager with no remedy at all. This was a contention to which he was entirely unable to accede. He was of opinion the local authority could not do anything of the kind, any more than they could before the expiration of the period stated in their notice. If the work was not done within a specified time, and the time allowed being reasonable, the Council might intervene under the express power of the Act and do the work themselves. But, added his Lordship, he was of opinion that unless and until the Council so intervened, and in the absence of some express notice, the frontager who had *bond-fide* commenced to execute the work, might, after the specified period of time, proceed with the work or require to have it done in due course. Even where it was agreed that the notice was at an end, he was not certain that a new notice might not be necessary.

In the present instance it appeared there were negotiations for an arrangement between the parties. It went off, however, on the question of the builder paying the Council inspector's fee, which defendants had no legal right to impose, although it might be done by agreement. But the plaintiff resented the charge, and would not pay it. There was no unreasonable delay on his part. On the whole, the learned Judge said, he came to the conclusion that the plaintiff was entitled to have his surface-water pipes connected up. The local authority were in the wrong upon the law, and therefore were liable for the costs of the litigation. Of course, the Council could appeal.

Mr. Younger, K.C.: Yes, but there will be no order, except that the defendants pay the costs.

Mr. Hughes, K.C.: There will be leave to the defendants to appeal if so advised?

The Judge: Yes; but I don't encourage you to appeal if only on the question of costs.

LONDON COUNCILS.

Barking.—Plans lodged by the Lamp Black Company, Ltd., for the erection of a lamp black factory in Harts-lane, have been approved. Mr. W. E. Davey, whose tender was recently accepted for the erection of the administrative block at the hospital, has been allowed to withdraw his tender as, in consequence of the general increase in the cost of materials, the price for the work would have to be increased by 10 per cent.

Battersea.—The Borough Surveyor has been instructed to prepare estimates with a view to making-up and paving of several roads on the Battersea-rise House Estate. Plans have been passed for Mr. W. H. George for the erection of sixteen houses in Muncaster-road.

Berkhamsted.—Plans have been passed for the Berkhamsted Tenants, Ltd., for the erection of eight houses.

Bethnal Green.—The tender of the Acme Flooring and Paving Company (1904), Ltd., has been accepted for supplying 30,000 8-in. by 3-in. by 5-in. creosoted deal blocks, at 6*l.* 2s. 6d. per 1,000, and 3,000 8-in. by 3-in. by 4-in. creosoted deal blocks, at 5*l.* 1s. 6d. per 1,000.

Brentford.—Tenders are to be invited to carry out extensions to the workhouse laundry.

Camberwell.—The tender of the Devon Construction Company, Ltd., at 1,571*l.* 12s. 9d. has been accepted for kerbing, channelling, roadwork, and laying foundations for asphalt paving, etc., in a portion of Red Post-hill.

City of London.—At the last meeting of the Court of Common Council the Streets Committee were authorised to proceed with the necessary works for the construction of the subway across Cannon-street by Mansion House Station, at an estimated cost of 16,000*l.*

Croydon.—A portion of Norbury Brook, Dunbar-avenue, is to be covered over at an estimated cost of 120*l.* The Borough Engineer has been instructed to prepare plans, specification, and estimates for the erection of a library building in Brigstock-road, at a cost of 5,000*l.* The following plans have been passed:—Messrs. E. Pollard & Co., 29, Clerkenwell-road, E.C., alterations to premises, George-street; Mr. E. J. Saunders, 48, Wellesley-road, additions at St. Stephen's Church, Warwick-road; Mr. J. E. Trimble, Kilmartin-avenue, seven houses, Kilmartin-avenue; Mr. W. Capon, Streatham, S.W., four houses, Kilmartin-avenue; Messrs. Macintosh Brothers, 5, Station-road, West Croydon, four houses, Carlyle-road.

Deptford.—Mr. E. C. Pinks, Parliament-mansions, Victoria-street, S.W., has been appointed to take out the quantities of the new central library proposed to be erected in Lewisham High-road, and to perform the whole of the Quantity Surveyor's work in connexion with the building, including the adjustment of the accounts and all necessary measuring, at a remuneration of 2 per cent. on the eventual total cost of the building.

Ealing.—According to the Borough Surveyor, during the year ended March 31 last 13,900 super. yds. of Ealing stone had been manufactured by the Council's slab-making plant. The quantity laid during the period under review was 15,426 super. yds., as against 17,230 super. yds. during 1911. The cost of manufacture amounted to 1,175*l.* The profit of the year's work amounted at 627*l.*, representing roughly the difference in cost between making and issuing, the latter being charged at 2s. 6d. per yard, as compared with the Indurated Victoria at 3s. 8d.

East Ham.—The Borough Engineer has been directed to prepare plans and estimates for making-up a portion of Masterman-road. Sanction has been received from the Local Government Board to the borrowing of 3,622*l.* for the erection of additions to the swimming-bath. Negotiations are to be carried on with Millars' Timber and Trading Company, Ltd., for the laying of a different kind of wood-block from that specified in their contract, in connexion with the duplicating of the tram-lines in High street North. Plans have been passed for Mr. H. R. Beale for the erection of ten houses and one house and shop in Masterman-road. Mr. Aleck George has lodged plans for alterations and additions to Nos. 162 and 164, High-street North.

Finchley.—The General Purposes Committee are to consider and, if found desirable, to prepare a scheme for the formation of a public library. Plans have been passed for Mr. E. Brown, Messrs. Herbert & Tant, and the North Metropolitan Electric Tramways, Ltd., for the erection of a motor-garage in Woodside Grange-road; twelve houses, Stanhope-avenue; and extensions to the sub-station, Rosemont-avenue, respectively. The Middlesex County Council have been approached with the view to the removal and reinstatement of the tramway centre poles in the Great North-road, at an estimated cost of 3,587*l.* A sum of 1,650*l.* is to be borrowed for improvement works in ten streets.

Greenwich.—Tenders are to be invited for paving a portion of Thornley-place as a new street; also for making-up the footway and properly paving a portion of the roadway running parallel with the above-mentioned road. A portion of the wood-paving in Romney-road is to be laid with creosoted soft wood-blocks, at an estimated cost of 215*l.* A portion of Tunnel-avenue is to be repaired with granite, and portions of the footways are to be kerbed and channelled at a total estimated cost of 514*l.* Plans have been passed for Messrs. W. F. Blay, Ltd., and Mr. W. Harbrow, for alterations to premises of the Thames Export Packing Company, Ltd. Seawitch-lane, and for a mission hall in Trafalgar-road, respectively.

Hackney.—Portions of the footways in Dalston-lane and Graham-road are to be reformed at an estimated cost of 1,300*l.* Plans prepared by the Architect for the proposed north-west branch library in Northwold-road have been approved, and are to be forwarded to Mr. Carnegie for his approval. Tenders are to be invited for the work of erection, the cost of which is estimated not to exceed 5,250*l.* The following plans have been passed:—Mr. D. S. Barclay, eight houses, Craven-walk; Messrs. Rowlandson & Co., factory, Chatham-place; Messrs. Edmondsons, Ltd., eight houses, Leweston-place, Stamford-hill; Mr. J. E. Ashby, alterations and additions, motor garage, Well-street, for the London General Omnibus Company, Ltd.

Hammersmith.—Plans submitted by Mr. J. C. Platt have been approved for rebuilding Nos. 106 and 108, King-street. Messrs. Leslie Davis & Co. have lodged plans with the London County Council for the erection of a motor-garage, adjoining the "Seven Stars" Hotel, Paddenswick-road.

Hendon (Rural).—The tender of Messrs. Halsey, at 192*l.* 4s. 6d., has been accepted for extending the Harrow Weald sewer.

Lambeth.—During the current financial year the carriageways of six streets are to be paved with asphalt, one with Swedish paving-blocks, and a portion of another with creosoted deal blocks, at a total estimated cost of 14,500*l.* Plans have been passed for Messrs. J. A. J. Woodward & Sons, on behalf of Mr. J. Dennis, for carrying out drainage works to three houses proposed to be erected in Dolland-street. Plans have been lodged with the London County Council by Mr. C. H. Young and Mr. F. E Harris for the erection of working-class dwellings upon the site of Nos. 41-3, Webber-street, and for a cinematograph hall on the site of No. 135, Dulwich-road, respectively.

Lewisham.—Artificial stone in lieu of tar-paving is to be laid in six roads at an estimated cost of 372*l.* The following plans have been passed:—Messrs. Edmonsons, Ltd., four houses, Mayow-road; Messrs. J. W. Heath & Sons, six houses, Arthurdon-street; Mr. A. W. Dawson, motor garage, Queens-road; Mr. C. R. Turner, garage, Montpelier-row. Mr. F. E. Rosser has lodged plans with the London County Council for the erection of six houses in Honor Oak-road.

Maldens and Coombe.—The following tenders have been accepted for various improvement works in Kingston-road:—Messrs. E. & E. Ilos, Wimbledon, kerbing, channelling, and forming the carriageway, footway foundations, and constructor of surface-water sewer, 1,234*l.* 13s. 3d.; Atlas Stone Company, Ltd., Cambridge, paving footway with artificial stone slabs, 217*l.* 15s.; Messrs. J. Wainwright & Co., Ltd., Shepton Mallet, paving carriageway margins with tar macadam, 273*l.* 4s. 3d.

Poplar.—Messrs. Edwin Evans & Son have had plans passed for the erection of nine houses in Ridgdale-street.

Southwark.—Messrs. Z. King & Son, 171, Victoria-street, S.W., have lodged plans with the London County Council for consent to the re-erection of Nos. 42-4, Old Kent-road, S.E.

Surbiton.—A certain portion of the area under the Council's control has been approved and adopted as the area to be included in their first town-planning scheme.

Wandsworth.—Tenders are to be invited for paving Gatwick-road, Southfield, part of Seely-road, Tooting, and part of Beechcroft-road, Balham, as new streets; also for paving with wood the carriageway between the kerb and the outer tramway rails of Long-road, Clapham Common. Tender of the Improved Wood-Pavement Company, Ltd., has been accepted for paving works in the following roads at the prices mentioned: — Wimbledon-road, 1,653*l.*; portion of Mitcham-lane, 6,659*l.*; portion of Southcroft-road and parts of Rectory-lane and Mitcham-road, 1,630*l.*; part of Clapham Park-road, 780*l.* The following plans have been passed:—Mr. R. J. Thomson, erection of Weir Hospital, Grove-road, Balham; Mr. S. R. Spinner, shop and house, Chestnut-grove, Balham; Messrs Allen & Norris, ten houses, Wimbledon Park-road, Southfield; Mr. W. R. Williams, additions to All Saints' Church, Lower Putney-common; Messrs. W. H. Lorden & Son, alterations and additions to No. 102, East-hill, rebuilding Nos. 2 and 4, Fairfield-street, Fairfield, and alterations and additions to Nos. 412, 414, and 416, Streatham High-road.

West Ham.—Plans, specifications, etc., by the Surveyor have been approved for making-up portions of Saville-road and Leonard-street. The tender of Messrs. S. Blow, Ltd., 34-5, Upper East Smithfield, E.C., has been accepted at 727*l.* 5s. 8d. for the erection of a handicraft centre at the Upton-lane School. Tenders are to be invited for executing private street works in Sugar House-lane. Messrs. J. Garrett & Son's tender has been accepted, at 3,158*l.*, for the erection of a coal wharf bunker at the generating-station. The following plans have been passed:—Messrs. T. Young & Sons, alterations and additions to Nos. 2, 4, 22, 24, and 26, Well-street, Stratford; Messrs. Green & Smith, alterations to "Essex Arms" public-house, Victoria Dock-road, Tidal

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xvi.; Auction Sales, xxii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Competitions.

JUNE 28.—**Hale, Cheshire.**—TOWN-PLANNING SCHEME.—Premiums 50*l.* and 25*l.* Particulars from the Council Offices, Hale. See issue of May 24 (page 601).

* JUNE 28.—**Regent's Quadrant.**—DESIGN FOR TREATMENT.—Premiums, 25 guineas, and 25 guineas divided. Adjudicators, Mr. W. Flockhart, Mr. E. A. Rickards, and Mr. Alan E. Munby. See advertisement in this issue for further particulars; also "Competition News," issue of April 19 (page 453), May 3 (page 512), May 10 (page 537).

JUNE 29.—**Reigate.**—LAYING-OUT AND DEVELOPING REIGATE LODGE ESTATE.—Premiums 30 guineas and 10 guineas. Particulars from the Town Clerk, Reigate.

JUNE 30.—**Padiham.**—TOWN HALL, BATHS, ETC. —Premiums 40*l.* and 20*l.* Particulars from Mr. J. Grogson, A.M.Inst.C.E., Surveyor's Office, Padiham.

JULY 1.—**Dusseldorf.**—A plan for the extension of the City of Dusseldorf. Premiums of 1,000*l.* to 375*l.* Conditions on application to the Chief Burgomaster, Dusseldorf. A translation appeared on page 365, September 29.

JULY 1.—**Fort of London.**—NEW OFFICES.—Limited to those mentioned in "Competition News," issue of April 12 (page 424).

JULY 5. — **Conisbrough.** — ADDITIONS TO HOSPITAL. The Doncaster and Mexbrough Joint Hospital Board invite competitive plans for additions to Isolation Hospital. See advertisements in the issues of May 17 and June 7 for further particulars.

AUGUST 6. — **Cardiff.** — FIRE-STATION. — The Cardiff Corporation invite designs and estimates for a fire brigade station in Westgate-street. Mr A. Marshall Mackenzie, assessor. Particulars from the Town Clerk, City Hall, Cardiff.

AUGUST 30. — SAXON SPELL PRIZE. — Fifty guineas, with medal, is offered for essay on "The Lighting, Heating, etc., of an Operating-Room for a General Hospital." Particulars from the Sanitary Institute, 90, Buckingham Palace-road, S.W.

SEPTEMBER 1.—**Goole.**—MUNICIPAL OFFICES.—Premiums 30*l.* and 15*l.* Particulars from Mr. R. Tyson, Council Offices, Goole.

SEPTEMBER 30.—**Dublin.**—UNIVERSITY COLLEGE: NEW BUILDINGS.—Limited to architects in Ireland. Assessor, Mr. H. T. Hare, F.R.I.B.A.

OCTOBER 1. — **Ottawa.** — MONUMENT TO KING EDWARD VII.—Sketch models in plaster to be sent to the Director of National Art Gallery, Ottawa.

NO DATE.—**Jordanhill, Glasgow.**—PROPOSED TRAINING COLLEGE.—Limited to six firms, named in "Competition News," December 1, page 635.

NO DATE. — **Warrington.** — SCHOOL. — The Warrington Education Committee invite competitive plans for the erection of a public elementary school. See advertisement in issue of February 16 for further particulars.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

JUNE 29.—**Aldbury.**—REPAIRS, ETC For painting, distempering, and repairs at the Isolation Hospital at Aldbury. Specification with Mr. A. W. Vaisey, Clerk, Berkhamsted.

JUNE 29.—**Halstead.**—WORKS.—For the reconstruction of the Halstead Caxton Works. Specifications and drawings at the Caxton Works Cottage, Trinity-square.

JUNE 29.—**Muckamore.**—ADDITION.—For building an addition to Ballyrobin National School, Muckamore. Plans and specification with Mr. W. D. R. Taggart, architect, 2, Wellington-place, Belfast.

JULY 1.—**Ferryhill.**—ALTERATIONS, ETC.—For remodelling cottages, King's Head Hotel Ferryhill; alterations to Shepherd's Arms, Billy Row, Crook. Plans and specifications with Mr. J Landell Nicholson, architect, 12, Grey street, Newcastle-on-Tyne.

JULY 1.—**Hatfield.**—ADDITIONS.—For alterations and additions to existing buildings at the Mill, Mill Green, Hatfield. Plans and specification with Mr. Ernest J. Dunham, Clerk, Hillside, Hatfield. Deposit of 5*l.*

JULY 1.—**Kington.**—BRIDGE.—Erection of a steel trough bridge and approaches over the stream on the Woodseaves road at Hobby Lyons, Eardisley. Plans and specifications with Mr. Bernard Phipin, Clerk to the Council, Duke-street, Kington.

JULY 1.—**Kirkburton.** HOUSE.—Erection of a boiler-house at the Hospital. Plans seen, and quantities from Messrs. Joseph Berry & Sons, architects, 3, Market-place, Huddersfield.

JULY 1.—**Stockton-on-Tees.**—ALTERATIONS.—For alterations to the secondary schools, Nelson-terrace. Plans and specification seen, and quantities from Mr. M. H Sykes, Borough Engineer, Town Hall, Stockton-on-Tees.

JULY 2.—**Sunderland.**—PAVILION, ETC.—For the erection of a pavilion at Barnes Park, and a shelter at Harbour View, Roker. Drawings and specifications seen, and forms of tender from Mr. John W. Moncur, Borough Engineer, Town Hall.

JULY 2.—**Walsall.**—FOUNDATION.—For the construction of a concrete foundation for No. 2 cooling tower. Forms of tender, with specification, from Mr. A. S. Barnard, M.Inst.E.E., Borough Electrical Engineer, Electricity Department, Wolverhampton-street, Walsall.

JULY 2.—**Watford.**—ROOM.—For the erection of a mortuary and post-mortem-room and for additional boiler-house accommodation at the Watford Union House. Drawings, specification, and a copy of the conditions and form of contract with Mr. W. H. Syme, F.R.I.B.A., architect, 58A, Vicarage-road, Watford. Quantities and form of tender on deposit of 1*l.* 1s.

JULY 3. — **Macclesfield.**—CONVENIENCES.—For erection of sanitary conveniences, Union Gateway. Specification and plans with Mr. Chas. W. Stubbs, Borough Surveyor.

JULY 3.—**Nelson.**—FRONT. For the erection of new shop front, etc., to the Nelson branch stores, for the Co-operative Society, Ltd. Plans and specification with Mr. William Dowdeswell, M.S.A., architect, Treharris.

JULY 3.—**Saddleworth.**—HOUSES.—Erection of ten houses for the working classes at Shaws, Uppermill; ten houses at Harrop Edge-lane, Dobcross. Plans, specifications, and conditions from Mr. Fred Thorpe, architect, Uppermill, or Union Bank-chambers, Church-lane, Oldham. Deposit of 10s. 6d.

JULY 3.—**Saddleworth.**—HOUSES.—Erection of thirty-five houses (twenty-five at Diggle and ten at Delph). Plans, specifications, and conditions from Messrs. Matley & Mills, architects, Ridgefield, Manchester. Deposit of 10s. 6d.

JULY 3.—**Somerton.**—ADDITIONS.—For alterations and additions at the schools. Plans and specification by the architect, Mr. R. Bowring, of Wells, Somerset.

JULY 4.—**Bedwas.**—SHOP, ETC.—Erection of shop and dwelling house on the Pant Glas Estate at Bedwas. Plans and specifications with Messrs. Gibson, Parry Williams, & Co., architects, Pontypridd.

JULY 4.—**Co. Down.**—PIER. For the repair of breach in main pier of Kilkeel Harbour, County of Down. Plans and specifications at the Office of the County Surveyor, Court-house, Downpatrick, Co. Down. Deposit of 1*l.* 1s.

Savill Brothers, alterations to the Brewery, Stratford; Messrs. Emden, Egan, & Co., cinematograph theatre, Barking-road, Canning Town; Mr. A. Foster, three cinematograph theatres, Plaistow, Silvertown and West Ham. Plans have been lodged by Mr. A. Smith, Messrs. Newman & Jacques, and Messrs. Fuller, Horsey, Sons, & Co., for the conversion of a chapel into picture palace, Bridge-road, Stratford; a women's settlement in Barking-road, Canning Town; and for alterations and additions to premises in Carpenters-road, Stratford, respectively.

Westminster.—The Works Committee have decided to construct an underground convenience adjoining that now existing in Vauxhall Bridge-road, at an estimated cost of 1,600*l.*, and tenders are to be obtained for carrying out the work. The Improved Wood Pavement Company, Ltd., contractors for annual paving work, have been allowed to sublet the part of their contract for footway construction work to Messrs. John Mowlem & Co., Ltd. Repairs are to be carried out to the macadam roadways of Exhibition-road and Tachbrook-street, at a total approximate cost of 250*l.* Various other repair works are to be carried out to footways at an estimated cost of 225*l.* The City Engineer has been authorised to carry out paving, etc., works in connexion with the widening at Nos. 12, Waterloo-place, and 30, Charles-street, at a cost not to exceed 400*l.* Mr. G. Thrale Jell and Messrs. Hughes & Son have lodged plans with the London County Council for the erection of a building on the site of Nos. 1, 3, and 5, Buckingham Palace-road, and for a building on the site of Nos. 87, 89, and 91, Tufton-street, respectively.

Willesden.—The following tenders have been accepted:—Mr. F. G. Brummell, making-up Newbury-road, 738*l.*, also Donnington-road, 529*l.*; Acme Flooring and Paving Company, Ltd., wood-paving portion of Chamberlayne Wood-road, 12s. 6d. per yard super.; Improved Wood Pavement Company, Ltd., wood-paving portion of Edgware-road; French Ashphalte Paving Company, laying new natural rock asphalt-paving in Malvern-road, 10s. 9d. per yard super. Plans prepared by the Engineer have been approved for making-up Kingthorpe-terrace, Dog-lane. Plans and estimates are to be prepared for making-up Victoria-mews. Plans are also to be prepared by the Engineer for the erection of slipper-baths at Church End and Kilburn at a cost not exceeding 4,500*l.* in respect of each building. The Town-Planning Committee have decided to prepare notices of the intention of the Council to apply to the Local Government Board for authority to prepare a town-planning scheme.

Wood Green.—Plans submitted by Messrs. H. E. Foster & Cranfield have been approved for the conversion of Nos. 108 and 108a, Middleton-road into a cinematograph theatre; as have also plans by Messrs. Barker & Kirk for additions to Walsham How Church, Maurice-avenue, Noel Park.

Woolwich.—A plan has been passed for Mr. J. J. Bassett, 121, Earlshall-road, Eltham, for the erection of eight houses in Dairsie-road, Eltham.

OBITUARY.

Mr. W. E. Wallis.

The death, on June 19, at Littlehampton, is announced of Mr. William Edmund Wallis, lately of Hill Cottage, Caterham, and of No. 12, Buckingham-street, Strand. Mr. Wallis was elected an Associate of the Royal Institute of British Architects in 1882. He was architect and surveyor to the Governors of the Peabody Trust and Donation Fund, for whom he planned and designed the blocks of buildings erected within the area bounded by Cambridge-circus, Minerva-street, Felix-street, and Centre-street, Bethnal Green, and on the Glasshouse-street, Whitechapel, site; and the dwelling-houses in Lillie-road, Fulham. He was the author, conjointly with Mr. John Honeyman, R.S.A., Mr. Owen Fleming, A.R.I.B.A., and Mr. Henry Spalding, F.R.I.B.A., of "Working-Class Dwellings," published twelve years ago.

Sir Lawrence Alma-Tadema, Knt.

We greatly regret to announce the death, on June 25, at Wiesbaden, of Sir Lawrence Alma-Tadema, O.M., R.A., R.W.S., H.R.S., F.S.A. He was Royal Gold Medallist, 1906, sharing, as a painter, that honour with only Lord Leighton (1894). He was elected an Honorary Associate in 1877 and, in 1901, an Honorary Fellow of the Royal Institute of British Architects; he served as a Vice-President, and member of the Art Standing Committee, 1906-7. He was Foreign Associate of the Institut de France, and Member of the "Ordre pour le Mérite" of Frederick the Great; a member of the Society of Portrait Painters, Chairman of the Artistic Copyright Society, and one of the Law of Copyright Committee, 1909. The son of Pieter Tadema, notary, he was born at Dronryp, in the Netherlands, on January 8, 1836; he had his earlier education in the Gymnasium, Leeuwarden, and studied in the Royal Academy, Antwerp, and the atelier of Henri Leys—some of his earliest work may be seen in the mural decoration of Antwerp Town Hall. He was elected A.R.A. in 1876, and R.A. in 1879; he received the honorary degrees of Litt.D., Dublin, in 1892, and D.C.L., Durham, in 1893. He painted the portraits of three Presidents of the Institute—John Whichcord, Alfred Waterhouse, R.A., and George Aitchison, R.A.; the first and last pictures are in the galleries, Conduit-street. He greatly beautified his own house and studios, No. 34, Grove End-road, St. John's Wood; he made several of the designs for Sir Henry Irving's production of "Cymbeline" and "Coriolanus," with the Forum scene, Senate House, and the house of Coriolanus, and, we believe, for "Julius Cæsar," for Sir Herbert Beerbohm Tree. Of Sir Lawrence Alma-Tadema's architectural pictures should be mentioned his "Architecture in Ancient Rome," "Thermæ Antoninianæ," "Baths of Caracalla" (as reconstructed), "San Clemente, Rome," and "Caracalla and Geta" in the Colosseum, also "A Favourite Custom" (bought by the Chantrey Trustees). "Picture Gallery of Ancient Rome," and "Street in Rome." His other chief works include "The Education of the Children of Clovis," "Egypt 3,000 Years Ago," "Pyrrhic Dance," "The Vintage," "A Roman Emperor," "Unconscious Rivals," "Roses of Heliogabalus," "Finding of Moses," a portrait of Paderewski, "Dedication to Bacchus," "Spring," "Pomona Festival," "Cleopatra," "The Kiss," "The Voice of Spring," "A Golden Hour," and "Preparations in the Coliseum," contributed to the current Royal Academy Exhibition. In our issue of January 26, 1907, we published extracts from a paper, "Marbles: Their Ancient and Modern Application," which he read to the Institute. In August, 1909, he was left a widower through the death of his second wife, daughter of the late Dr. George N. Epps, whom he married in 1871. On page 749 will be found an appreciation of the deceased artist and of his work.

Mr. R. Vigers.

Mr. Robert Vigers, who died on June 23, in his eighty-sixth year, at Wellesley House, Sloane-square, S.W., was a well-known surveyor and land and estate agent, practising at No. 4, Frederick's-place, Old Jewry, E.C., and a member of the Surveyors' Institution. He was a Past-President of the Institution and the father of Mr. Leslie Robert Vigers, at whose installation, in May, 1910, as President for the Session 1910-11, were present his father (the deceased) and his sons, Mr. Arthur Vigers and Mr. Allan Vigers—three generations of surveyors. Mr. Vigers managed many estates in London and the provinces; he enjoyed an extensive practice in relation to the compulsory acquisition of property in London by the Great Central and the London, Chatham, and Dover railway companies, as well as for the underground lines; he acted as arbitrator in respect of claims preferred by owners against the Manchester Ship Canal undertaking, and his services were retained in the negotiations for the freeing from toll of bridges in London, the taking over of tramways by the London County Council and local authorities in the country, and the purchase of telegraphs by the Government. He was for fifty years a member, and latterly an honorary member, of the Royal Society of Arts; he established the Surveyors' Institution Benevolent Fund, and gave largely to many charitable objects.

Mr. J. W. Clarke.

The death, on June 14, is also announced of Mr. J. Wright Clarke, of New Wandsworth, sanitary specialist and author of several standard books upon plumbing and sanitary science. He was for nearly thirty years instructor in plumbing at the Regent-street Polytechnic.

PATENTS.

APPLICATIONS PUBLISHED.*

9,910 of 1911.—William Alban Richards and Edgar Rouse Sutcliffe: Building-block and method of using same.

10,041 of 1911.—Arthur Petrie Florence: Kitcheners.

IS OPENED PROVISIONALLY.

POINTS OF MERIT:

Favourable Situation.

Immingham Dock is geographically the most central coal port for the Continent, and is in direct rail communication with the great coalfields of the West Riding and South Yorkshire, Derbyshire, Nottinghamshire, &c.

Always Accessible.

Immingham Dock has a storm-protected harbour and deep water channel and entrance lock, enabling the largest ships to enter and leave at any state of the tide.

Most Modern Equipment.

Immingham Dock has eight coal hoists capable of shipping 5,600 tons per hour.
Largest ships can bunker at deep water jetty—only ten miles from the open sea—at any time of the day or night.
Storage accommodation is provided for 11,600 loaded wagons, and there are 170 miles of sidings.
Every precaution taken to minimise breakage of coal.
Movable hoist enables two "holds" of a vessel to be loaded simultaneously.

Low Dock Charges.

Immingham Dock charges are more favourable than at any competitive port.

For Information apply Great Central Goods Agents or Port Master, Immingham Dock, Grimsby.
Illustrated Brochure "3" and Map "3," printed in English, French or German, post free from G.C.R. Publicity Office, 216, Marylebone Road, London, N.W.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than* 6 p.m. *on Wednesday.* [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100*l.* unless in some exceptional cases and for special reasons.]

* Denotes *accepted.* † Denotes *provisionally accepted.*
